

Neutrino Cross Section Experiments

45th Karpacz Winter School

Morgan Wascko
Imperial College London

Overview of Lectures

- Introduce neutrino cross section experiments
 - Only cover accelerator neutrino beams
 - Focus on recent measurements near 1 GeV
 - K2K, MiniBooNE, SciBooNE
- Experimental Methods
- Measurements, current and future
- Uncertainties

A note on style

- Informal lectures
- Please ask questions

A note on style

- Informal lectures
- Please ask questions

Especially basic questions!

Schedule of Talks

- 1 - Introduction & Experiments
- 2 - CCQE
- 3 - $\text{CC}|\pi^+$
- 4 - $\text{NC}|\pi^0$
- 5 - Other processes (NC Elastic, $\text{CC}|\pi^0$)
- 6 - Antineutrino measurements

Discuss
relation to oscillation
experiments here

Lecture I. Introduction

Lecture 1 Outline

- Overview of Accelerator ν Experiments
 - Motivation
 - Past Experiments
 - Hadron production experiments
 - Current Experiments
 - K2K
 - MiniBooNE
 - SciBooNE
 - Future Experiments

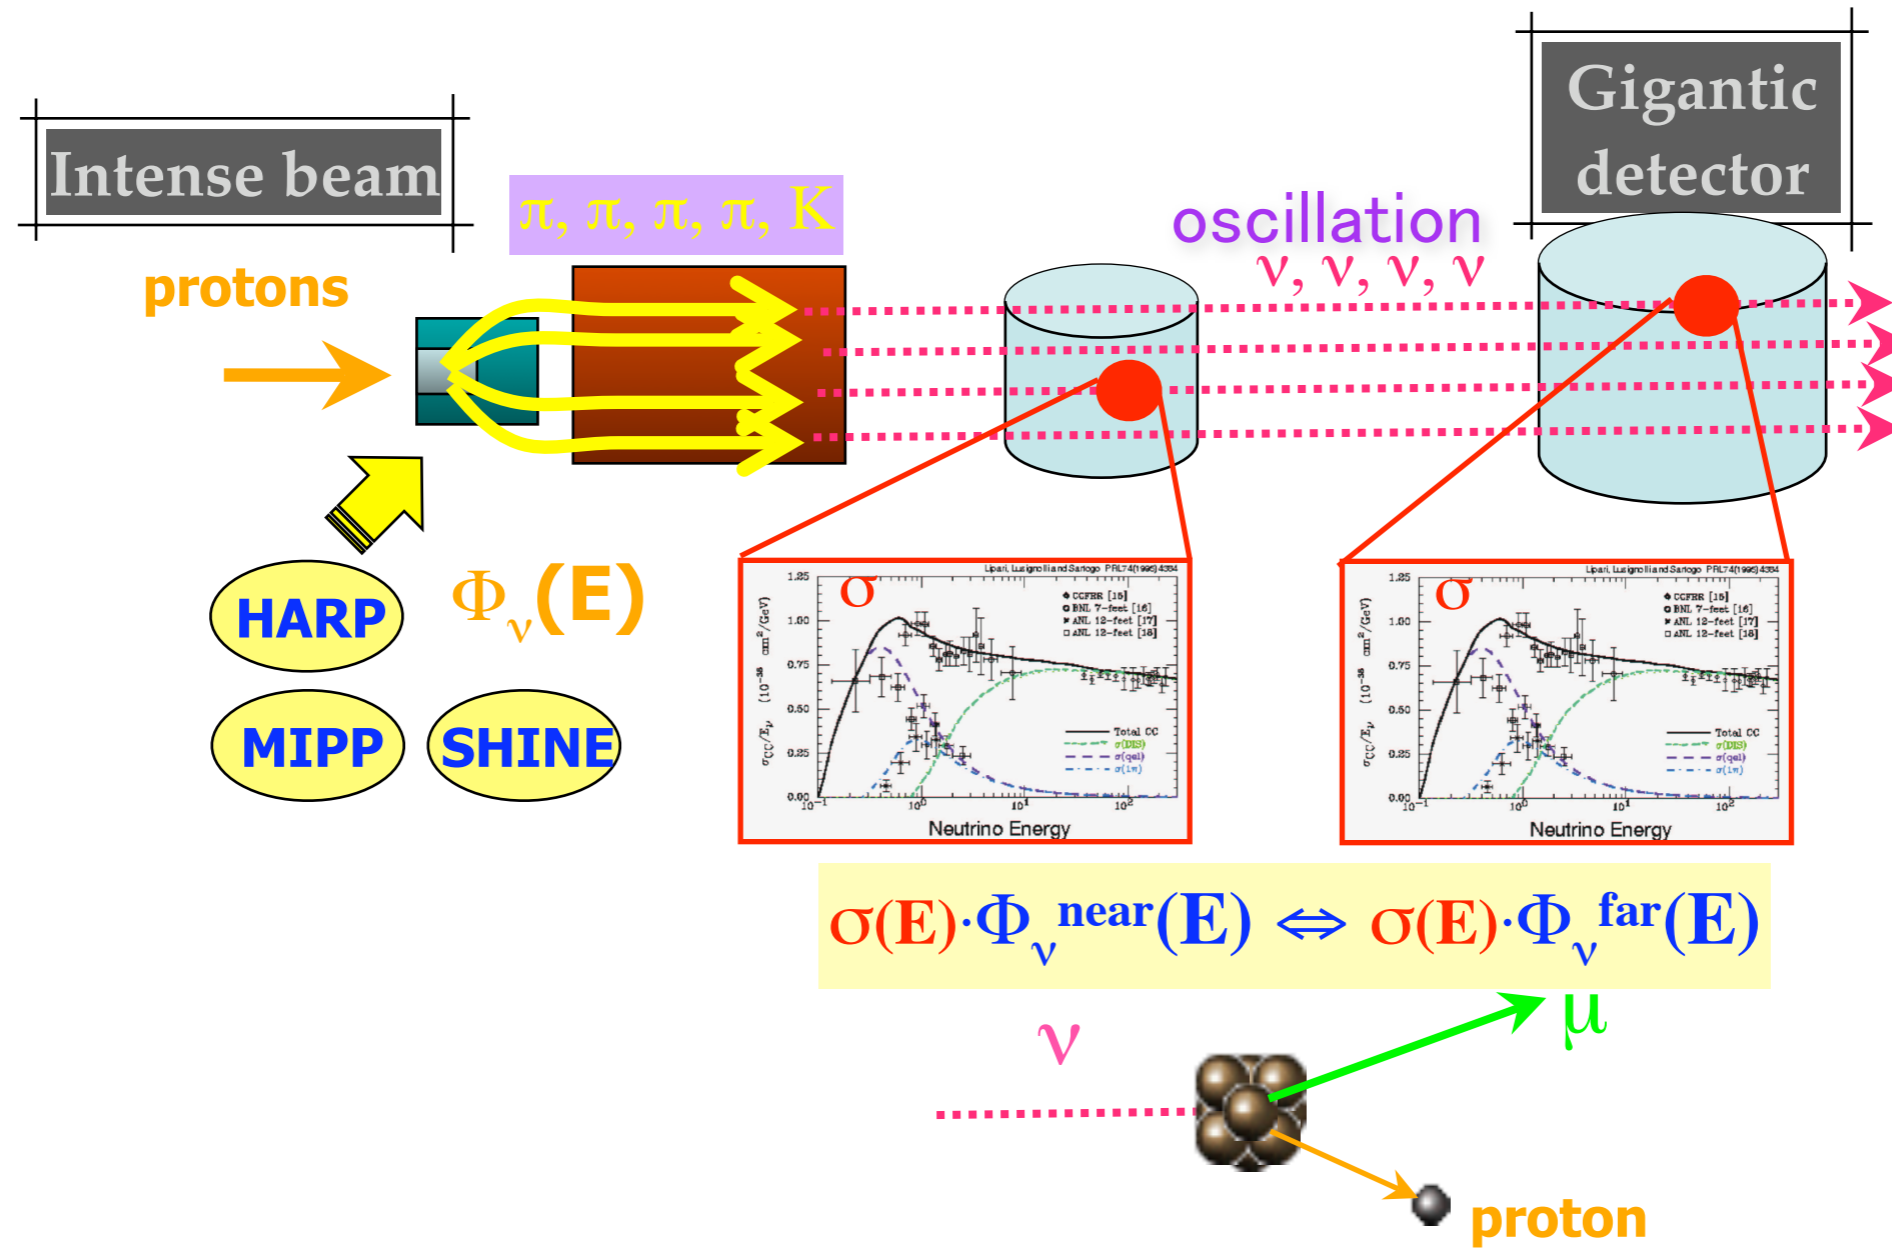

Accelerator Neutrino Experiments

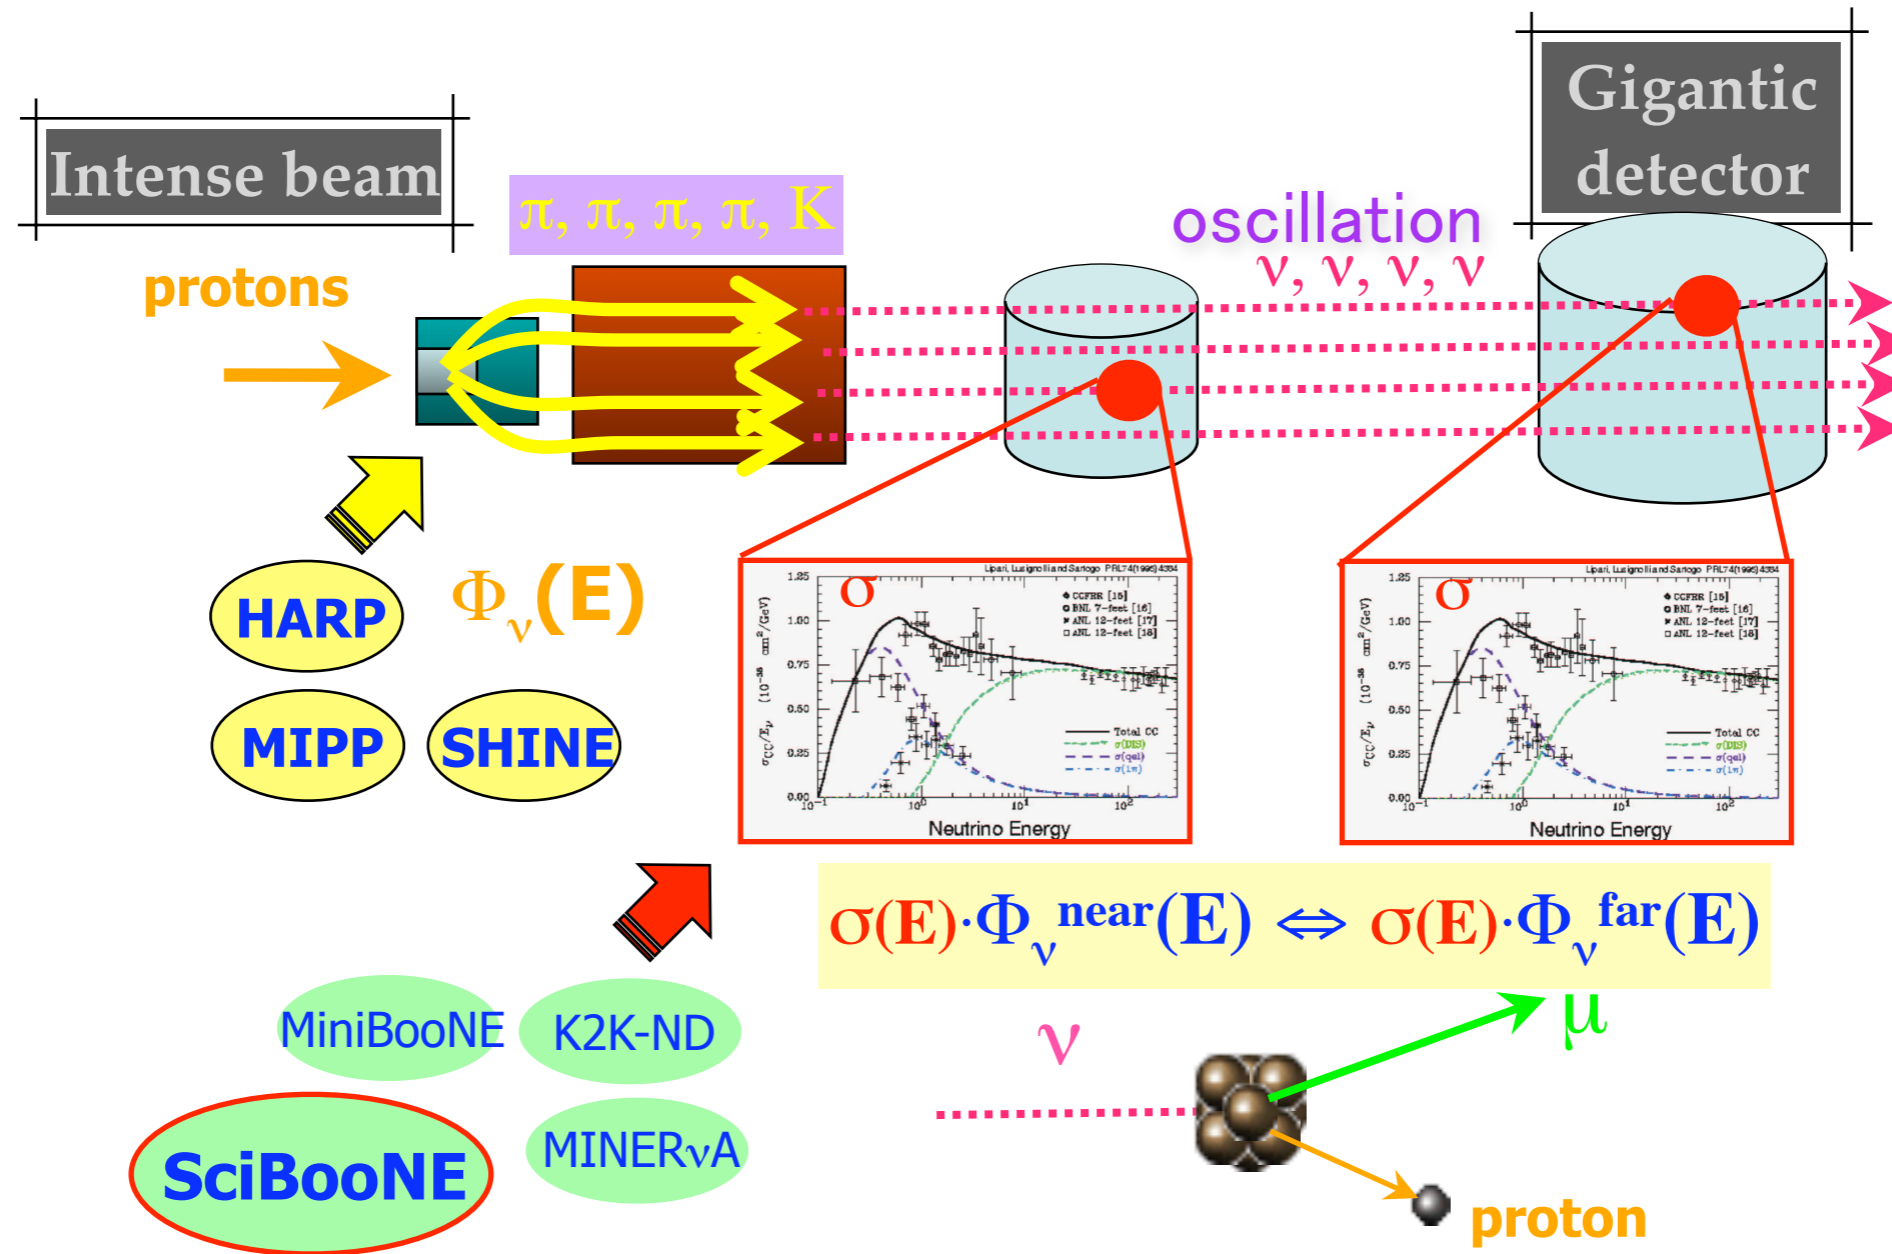

Accelerator Neutrino Experiments

Accelerator Neutrino Experiments

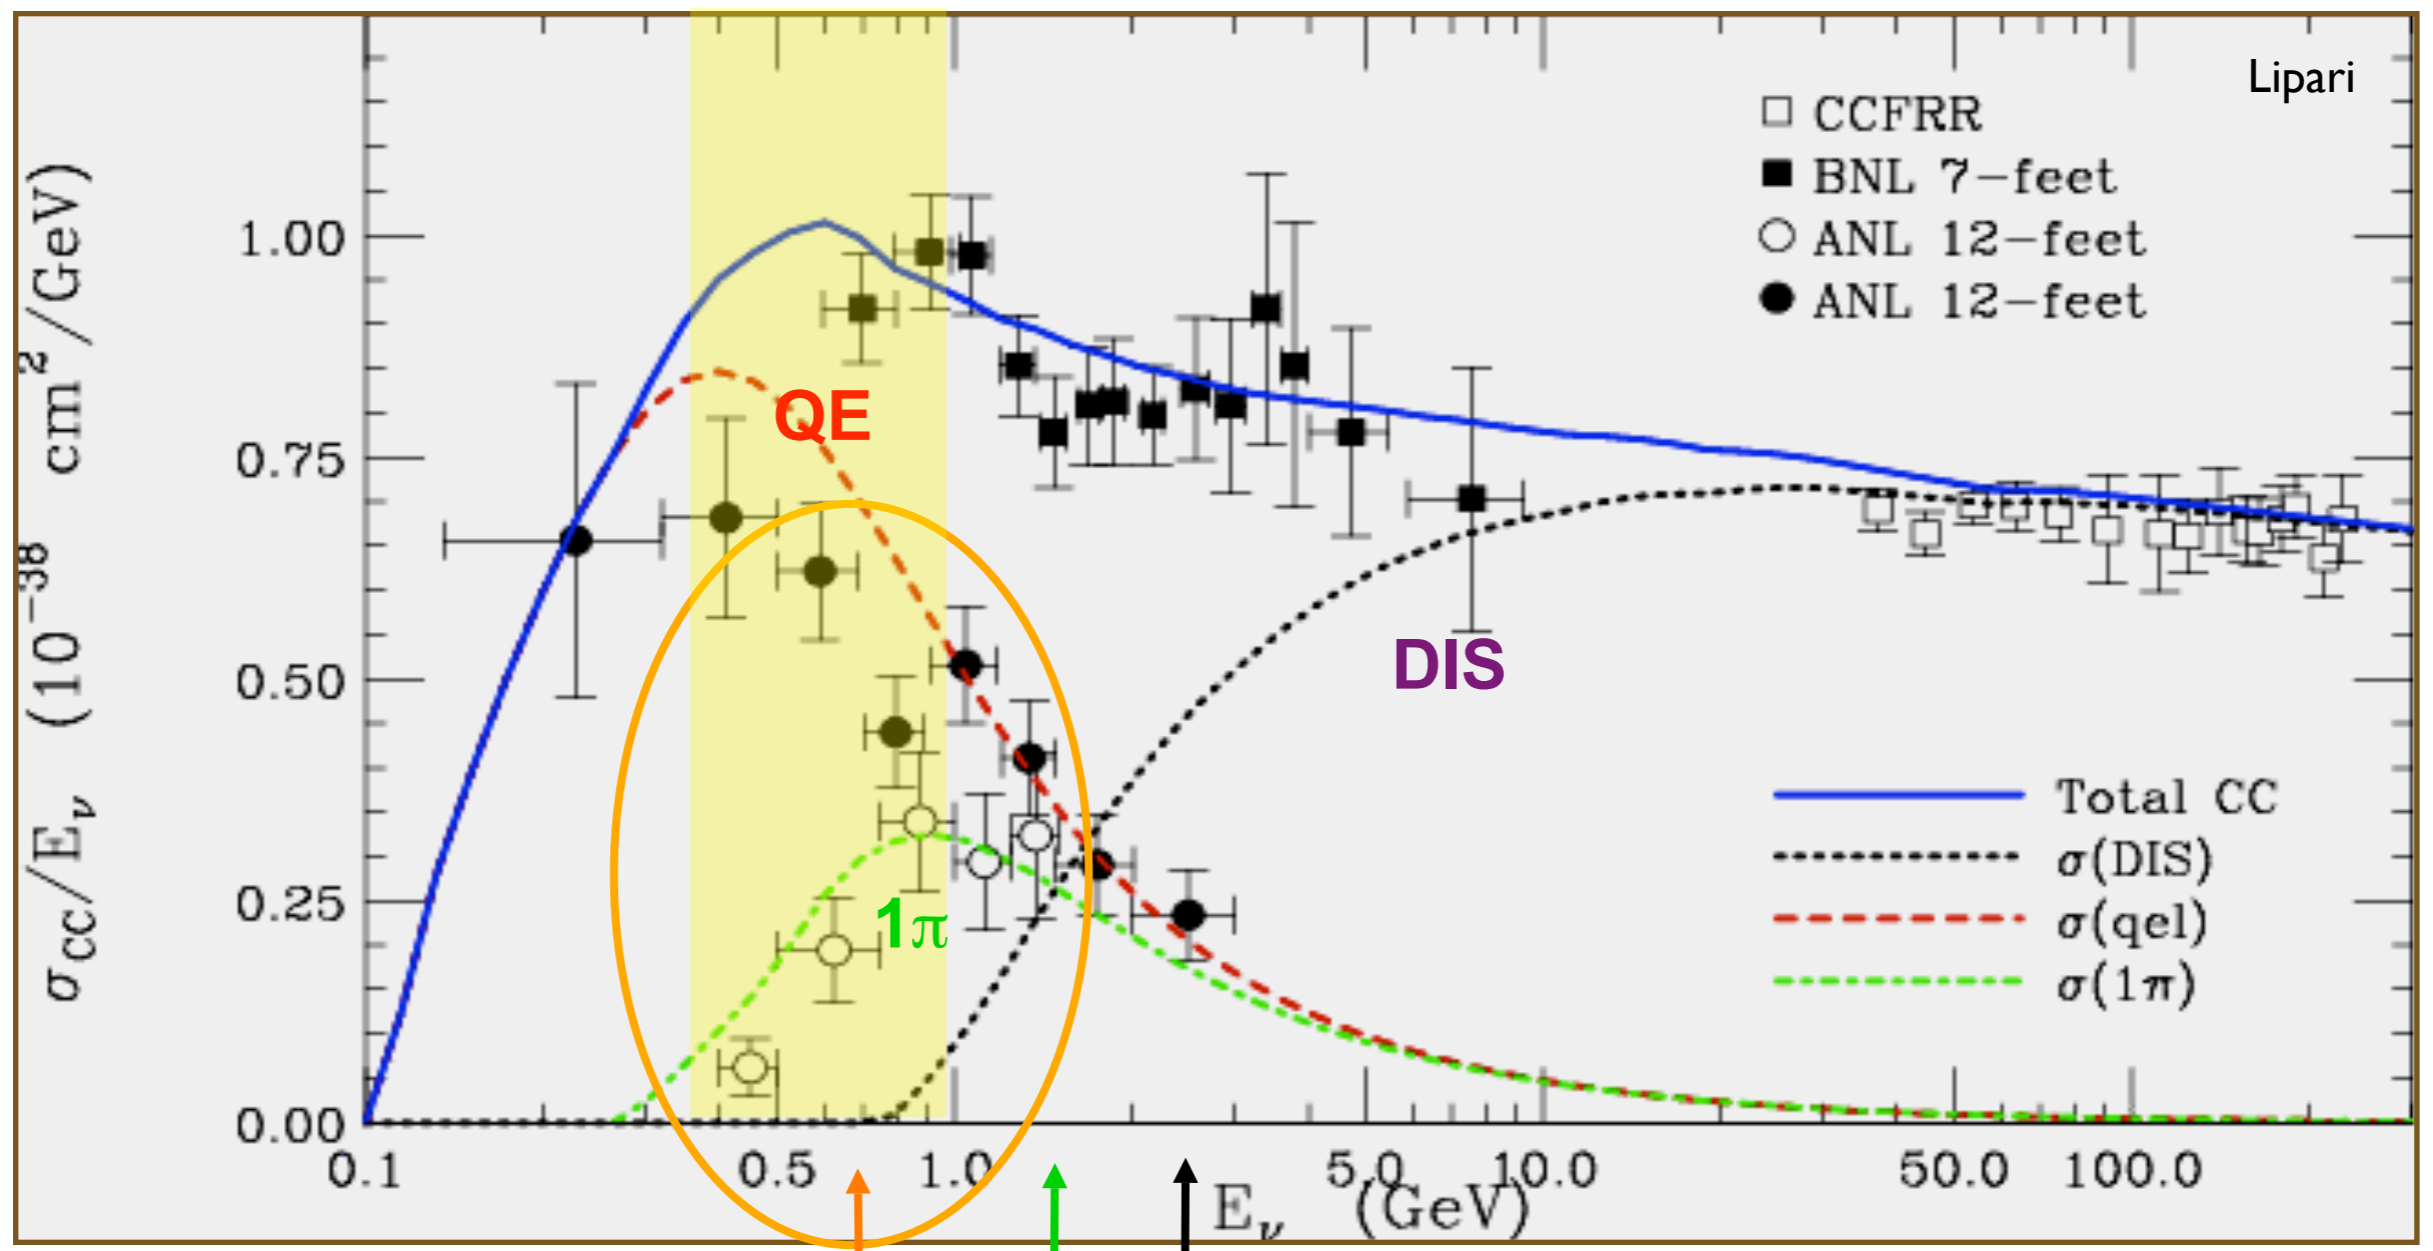

Accelerator Neutrino Experiments

Energy range

Neutrino oscillation searches drive need for better cross section knowledge

Past Experiments

- Bubble chambers
- First measurements
- Conventional neutrino beams

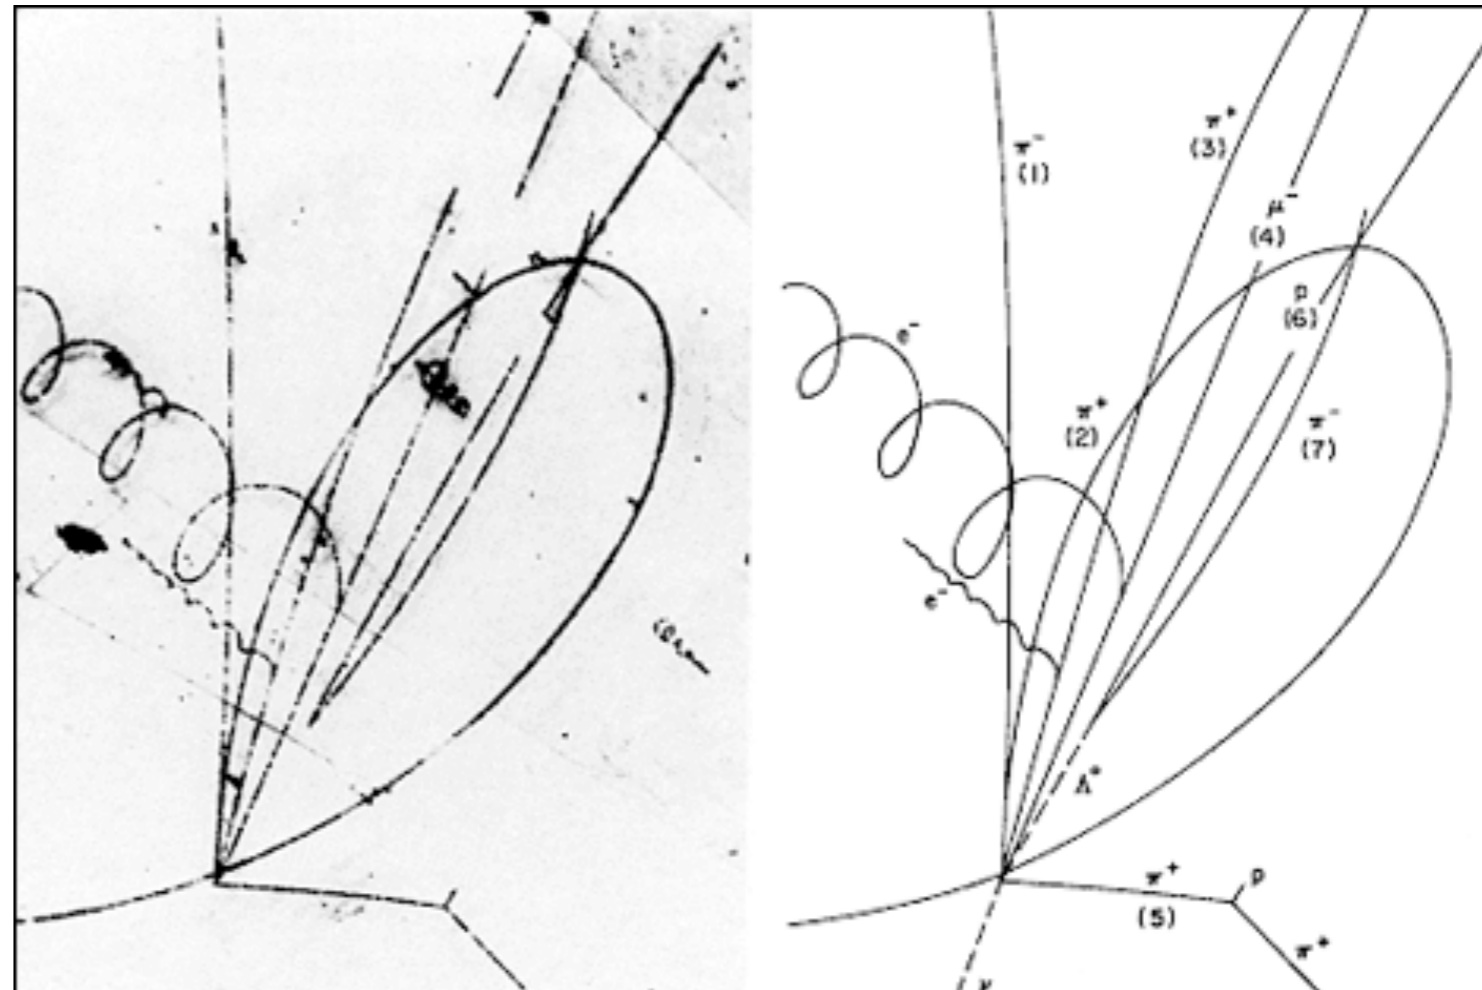

Bubble Chambers

- Super heated liquid
- Ionisation creates bubbles
- External trigger
- Cameras
- Very good position resolutions
- Slow reconstruction - human hand scanning
- Extremely limited statistics

Bubble Chambers

- Super heated liquid
- Ionisation creates bubbles
- External trigger
- Cameras
- Very good position resolutions
- Slow reconstruction - human hand scanning
- Extremely limited statistics

Bubble Chambers 2

- Bubble chambers used with neutrinos at CERN, ANL, BNL, FNAL
- Neutrino
- Antineutrino
- Slow data processing motivates use of electronic readout

Bubble Chambers 2

- Bubble chambers used with neutrinos at CERN, ANL, BNL, FNAL
- Neutrino
- Antineutrino
- Slow data processing motivates use of electronic readout

Conventional Neutrino Beams

First neutrino beam

- Lederman, Schwartz & Steinberger
- Discovery of 2 types of neutrinos
- Used an undirected, unfocused beam of pions to create neutrinos

Phys. Rev. Lett. 9, 36 - 44 (1962)

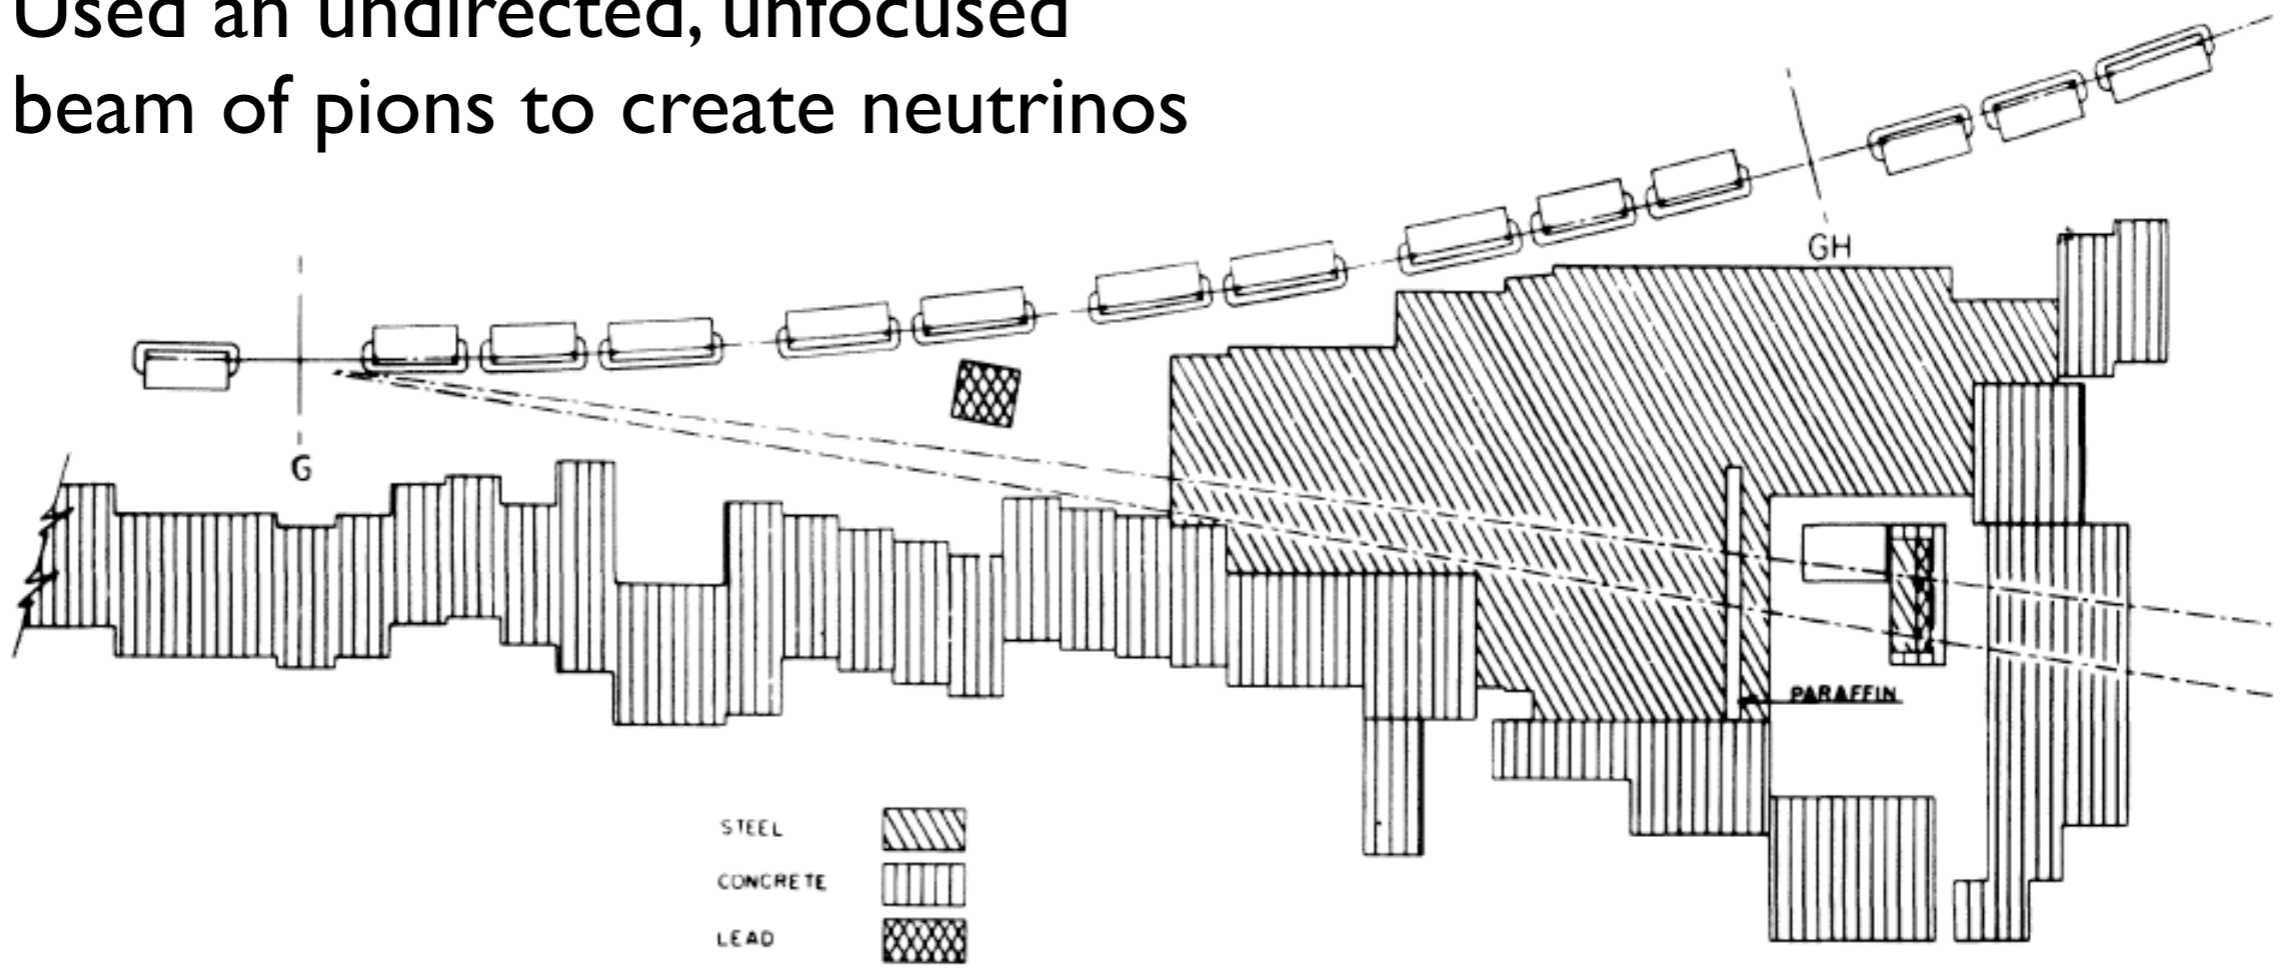

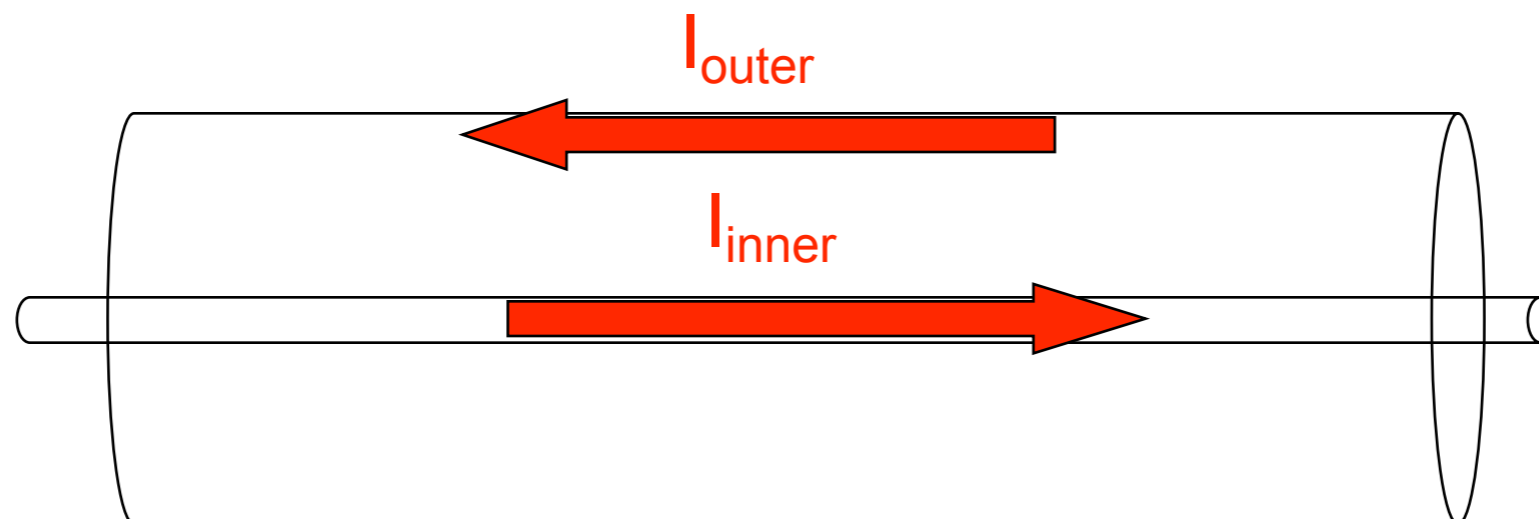

FIG. 1. Plan view of AGS neutrino experiment.

Increasing the flux of neutrino beams

- Simon van der Meer had an idea in the mid 60's:
 - Using two cylindrical current sheets
 - Create a toroidal magnetic field around the neutrino target to
 - Focus pions toward the neutrino detector
 - Increases flux, allows sign selection, some energy selection

Increasing the flux of neutrino beams

- Simon van der Meer had an idea in the mid 60's:
 - Using two cylindrical current sheets
 - Create a toroidal magnetic field around the neutrino target to
 - Focus pions toward the neutrino detector
 - Increases flux, allows sign selection, some energy selection

 - Create a toroidal magnetic field around the neutrino target to
 - Focus pions toward the neutrino detector
 - Increases flux, allows sign selection, some energy selection

Increasing the flux of neutrino beams

- Simon van der Meer had an idea in the mid 60's:
 - Using two cylindrical current sheets
 - Create a toroidal magnetic field around the neutrino target to
 - Focus pions toward the neutrino detector
 - Increases flux, allows sign selection, some energy selection

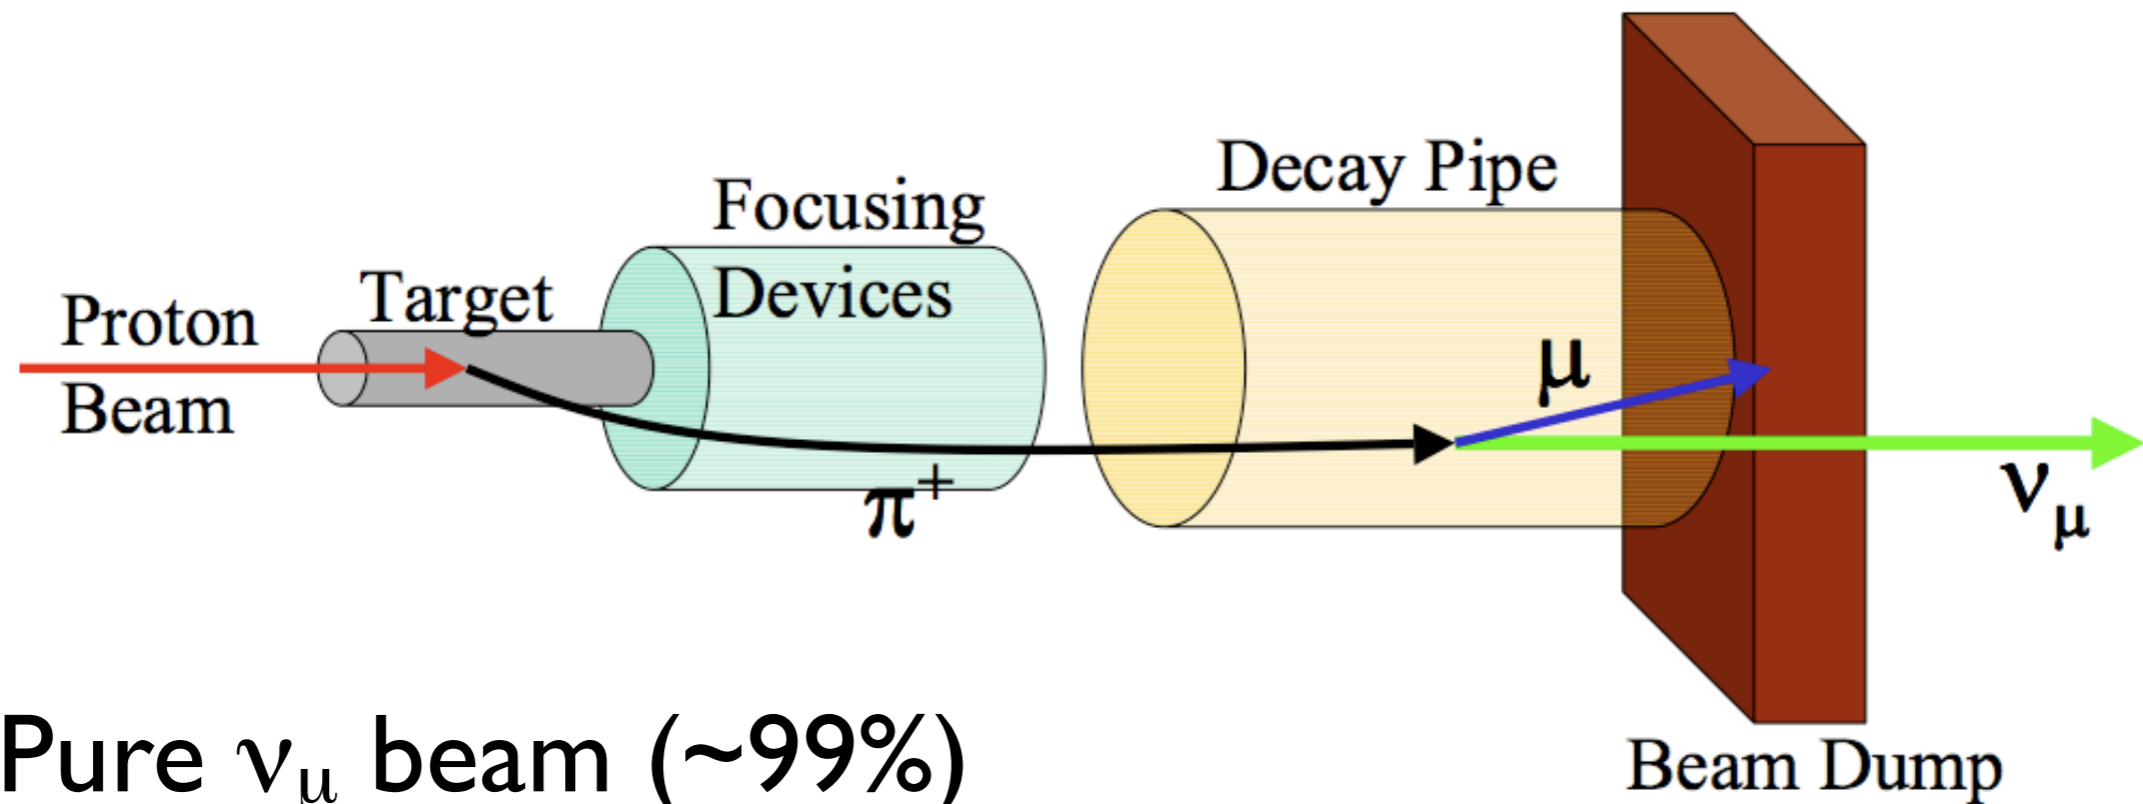

Horns

- These devices are called magnetic horns or just neutrino horns

Conventional characteristics

- Pure ν_μ beam ($\sim 99\%$)
- Slight ν_e contamination from muon and kaon (Ke3) decay
- Muon decay mitigated with short decay region
- Higher kaon content at higher proton energies
 - Tradeoff: beam power & purity

Beam References

- Phys.Rept.439:101-159,2007; [arXiv:physics/0609129v1](https://arxiv.org/abs/physics/0609129v1)

Hadron Production

- Neutrino flux directly related to the meson flux in decay region
- Uncertainties in meson flux lead to uncertainties in neutrino flux
- Need good meson production measurements
 - HARP at CERN

Harp Detector

NDC modules = 4 chamber x 3 planes (u,v,x) = 12 planes/module

TOFW + t0 Δt ~180 ps

Threshold mode: E_{th}^π = 2.6 GeV

Bending in xz plane: 0.5 T

Beam instrumentation

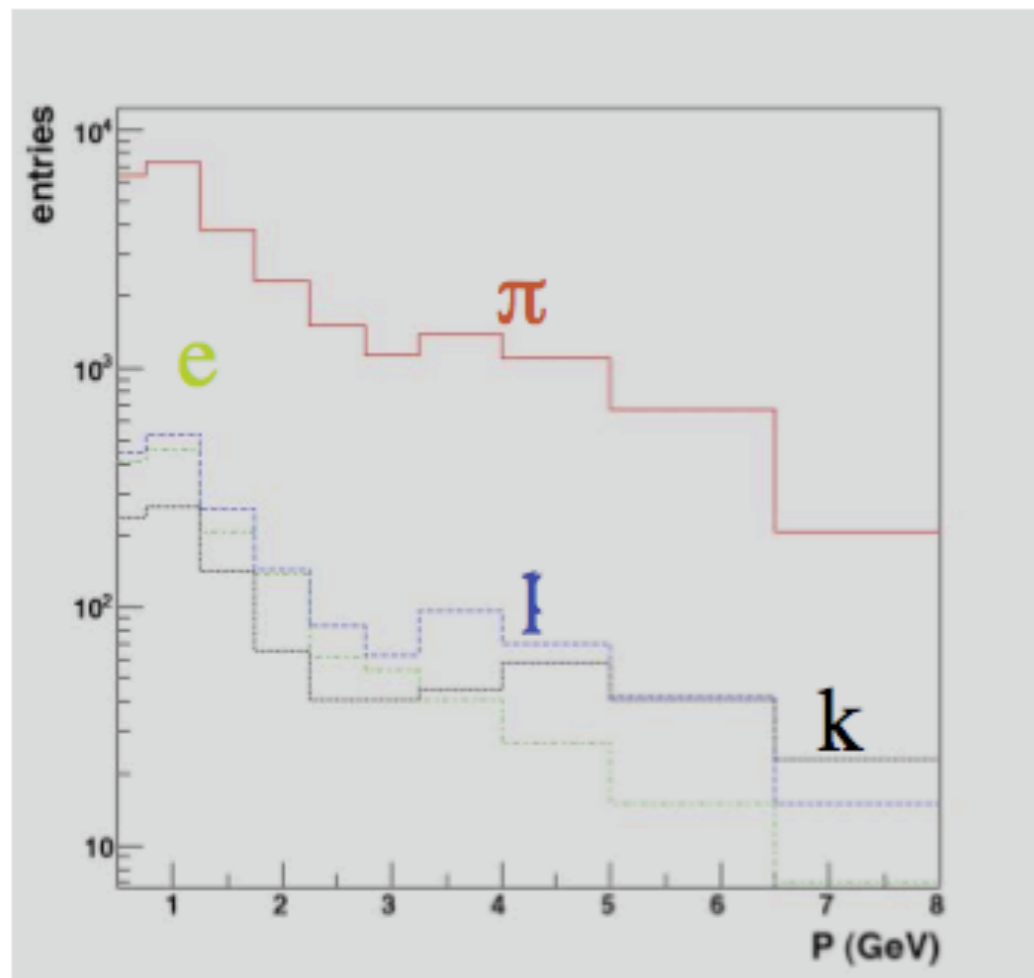

FTP gives interaction trigger

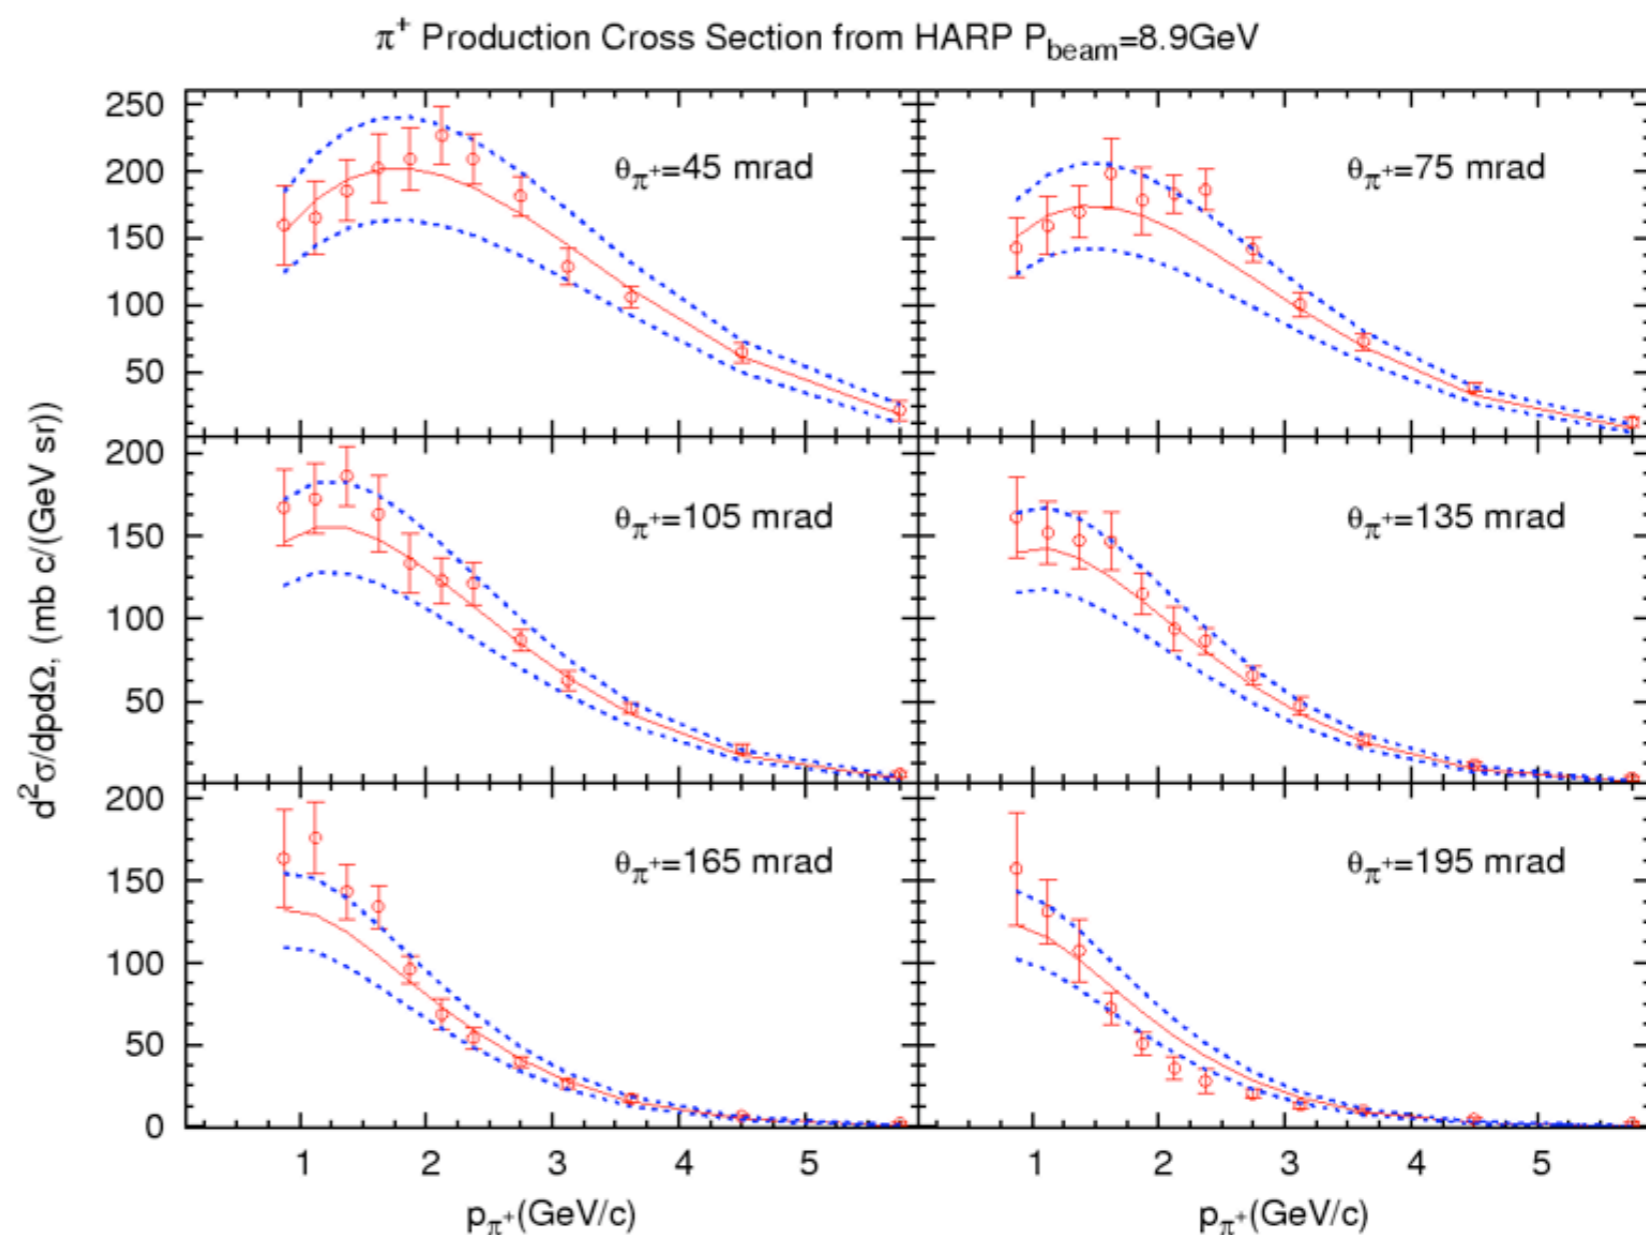

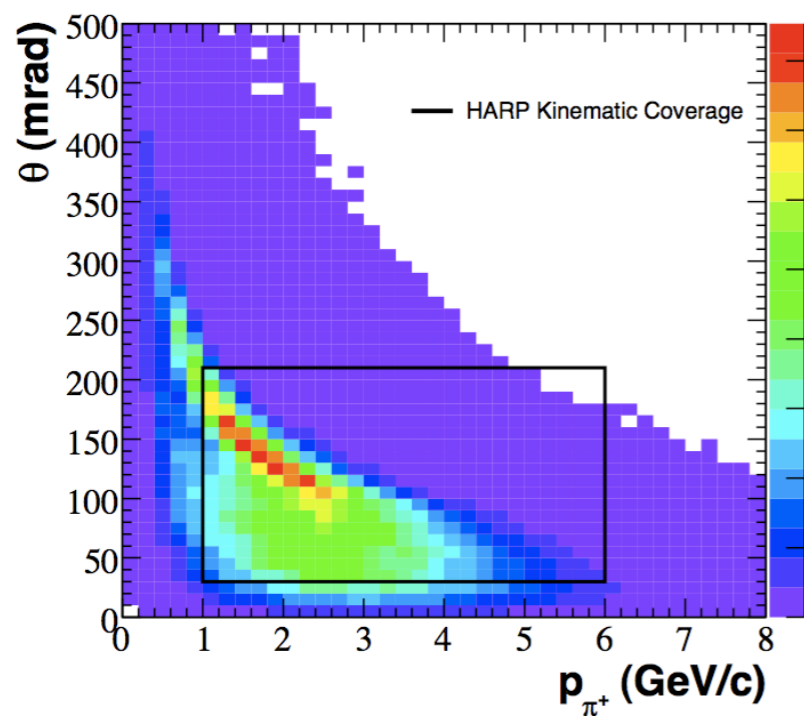

PID in Harp

MC simulation of particle yields

HARP Results (Be)

- 8 GeV KE protons
- Beryllium target
 - thin target
 - MiniBooNE replica target
- Wide coverage of meson phase space

BooNE Flux w/HARP

- Use HARP data with Sanford-Wang parameterization directly in BooNE flux MC
- ~17% uncertainty
- Direct interpolation of data (no S-W) yields ~8% uncertainty

[arXiv:0806.1449 \[hep-ex\]](https://arxiv.org/abs/0806.1449).

HARP References

Other Hadron production experiments

- MIPP (Main Injector Particle Production)
 - Fermilab
 - Ran in 2004-5
 - Analyzing data now
- SHINE (NA-61)
 - CERN
 - for T2K
 - Took data in 2007
 - Running more this spring (2009)

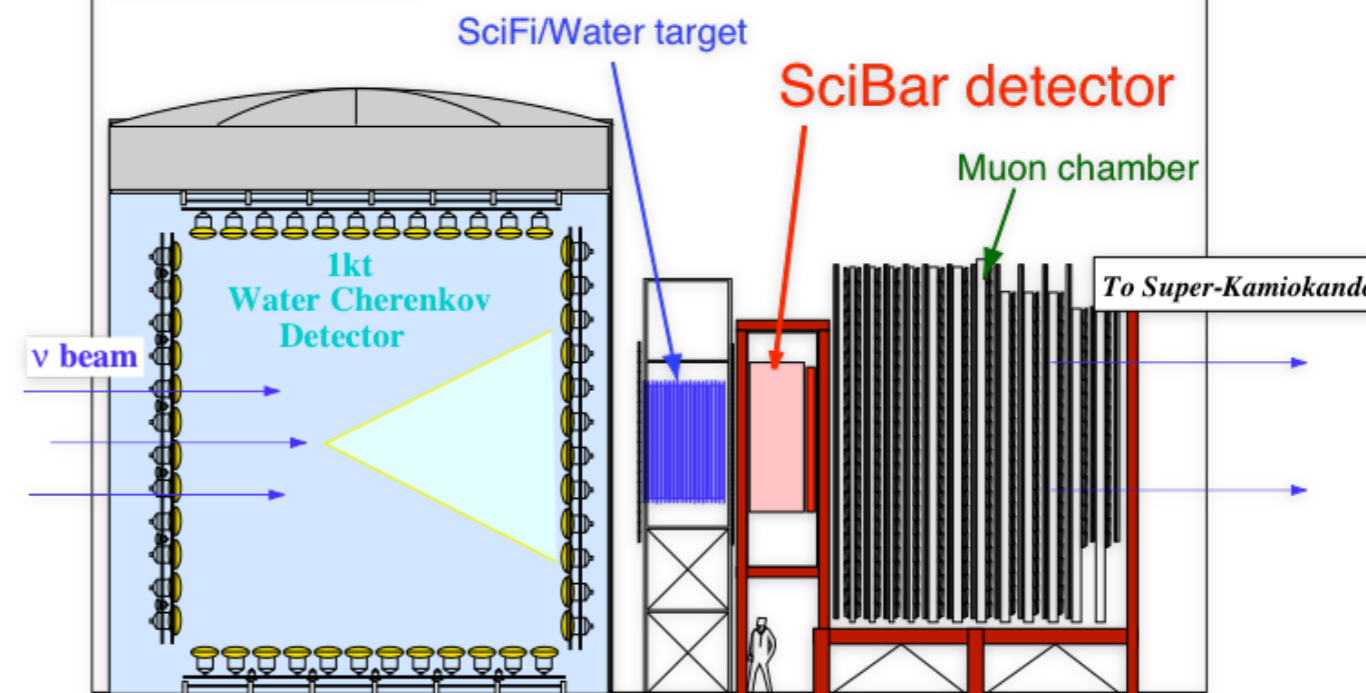

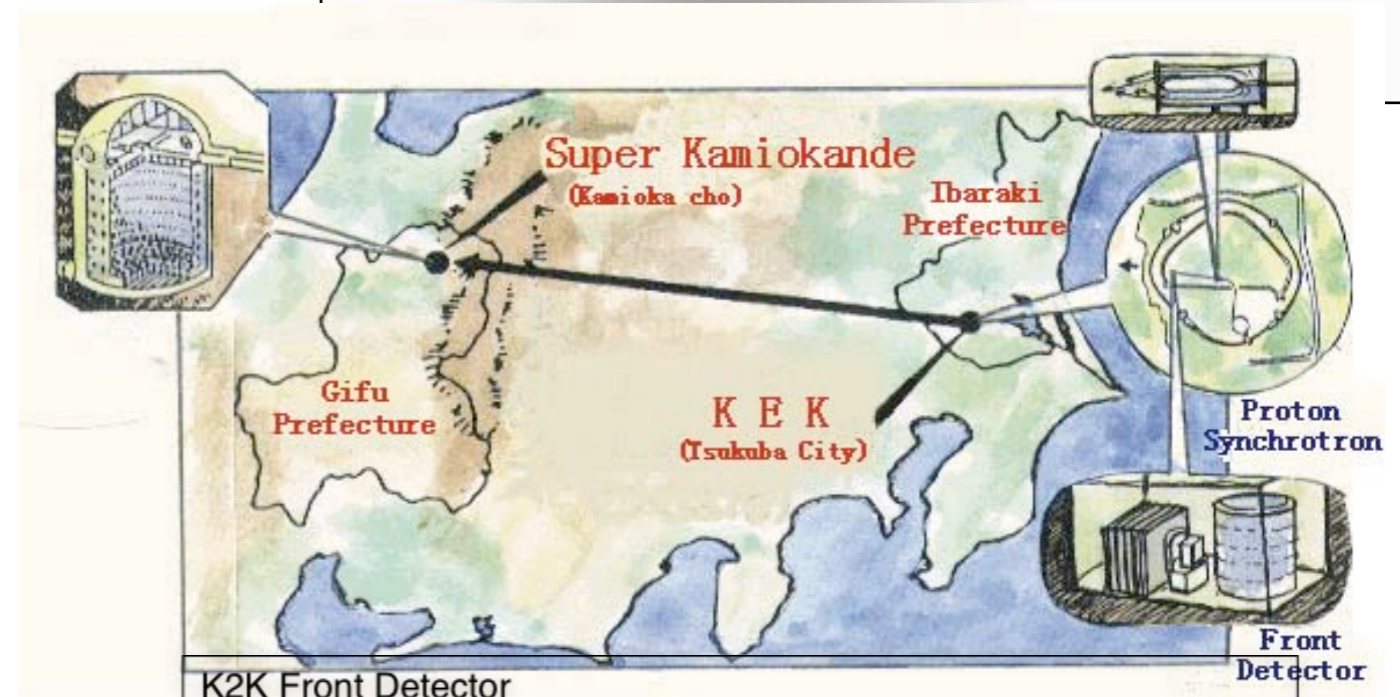

Neutrino Experiments

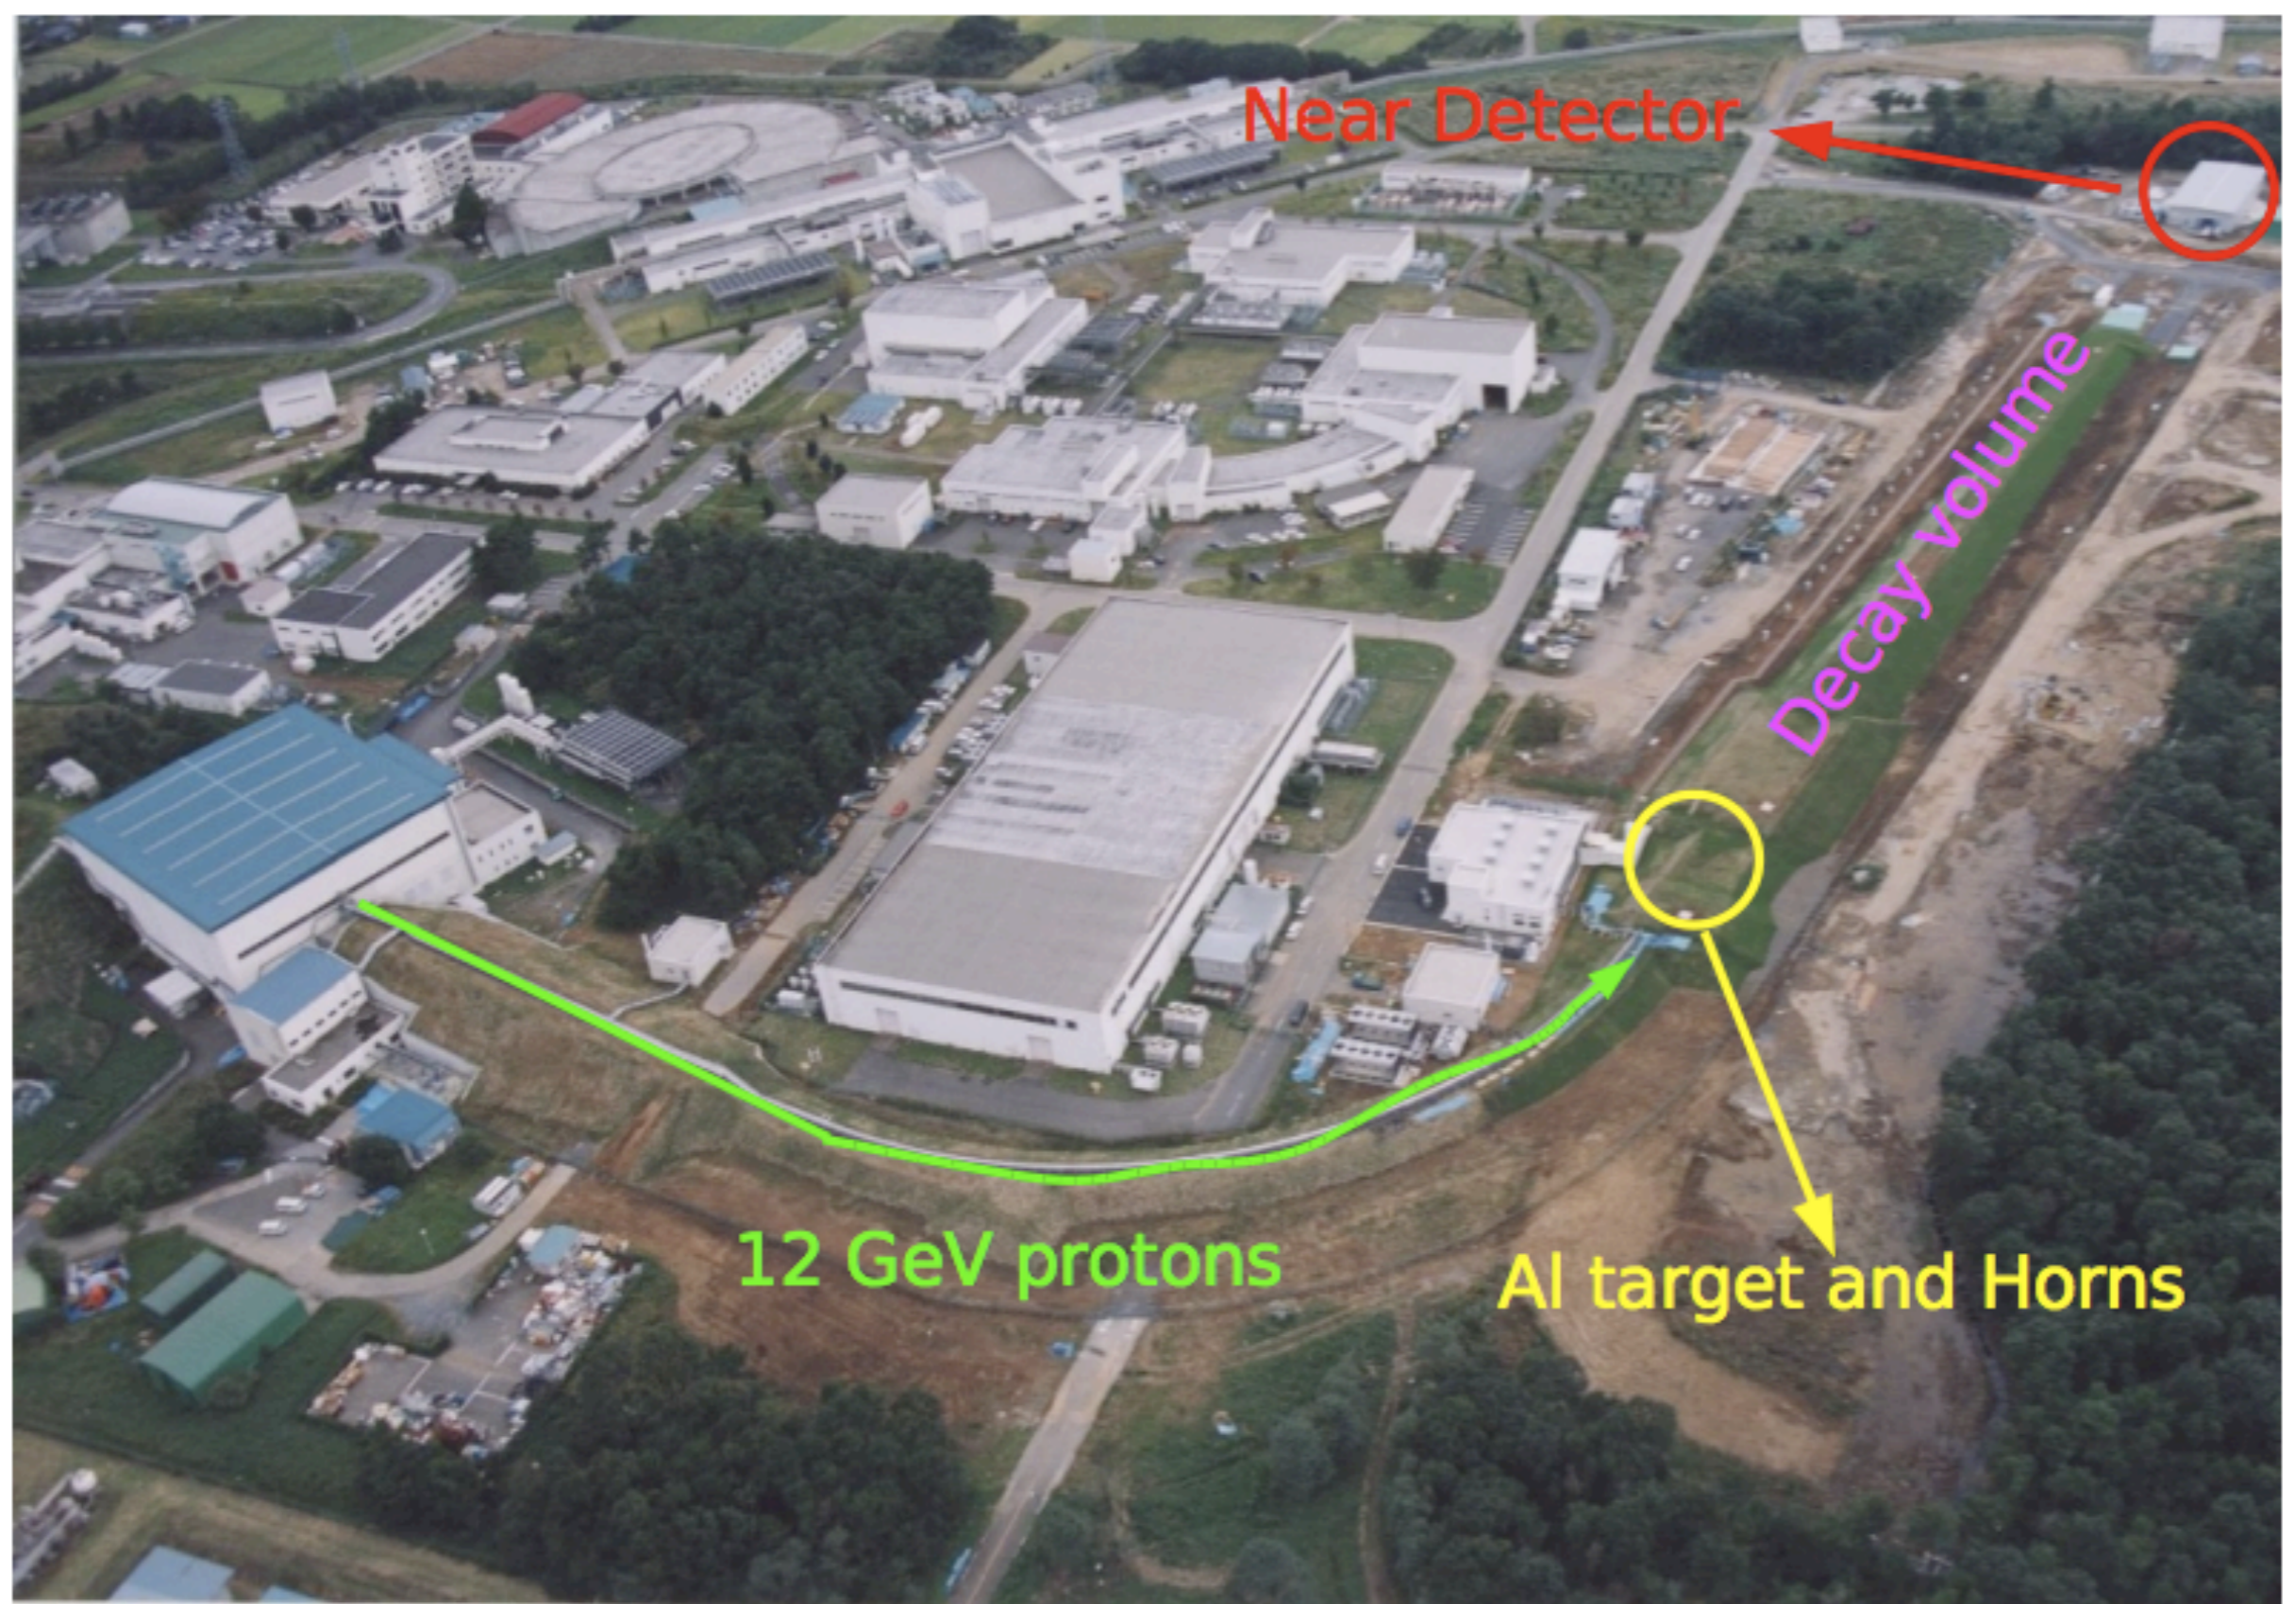

K2K Intro

- Designed to confirm atmospheric neutrino oscillations using Super-K as the far detector
- Suite of near detectors to observe un-oscillated neutrinos and measure neutrino cross sections
- Peak ν energy 1.3 GeV
- Renewed interest in neutrino cross sections at these energies

K2K Overview

K2K target/horns

- The production target is an Al rod
- Two magnetic horns focus mainly π^+
 - π^+ momentum $\sim 2\text{-}3 \text{ GeV}/c \rightarrow E_\nu \sim 1\text{-}1.5 \text{ GeV}$
- Neutrino flux with horns magnets is 22 times greater than without
- Maximum magnetic field 33 kG

- Target:
66 cm length, 3 cm diameter
- First horn:
2.37 m length, 0.70 m diameter
- Second horn:
2.76 m length, 1.65 m diameter
- Pulsed current:
2 msec duration and 250 kA amplitude

K2K Beam Monitoring

PIMON measured pion momentum spectrum

MUMON measured beam center position (pointing to SK)

K2K Performance

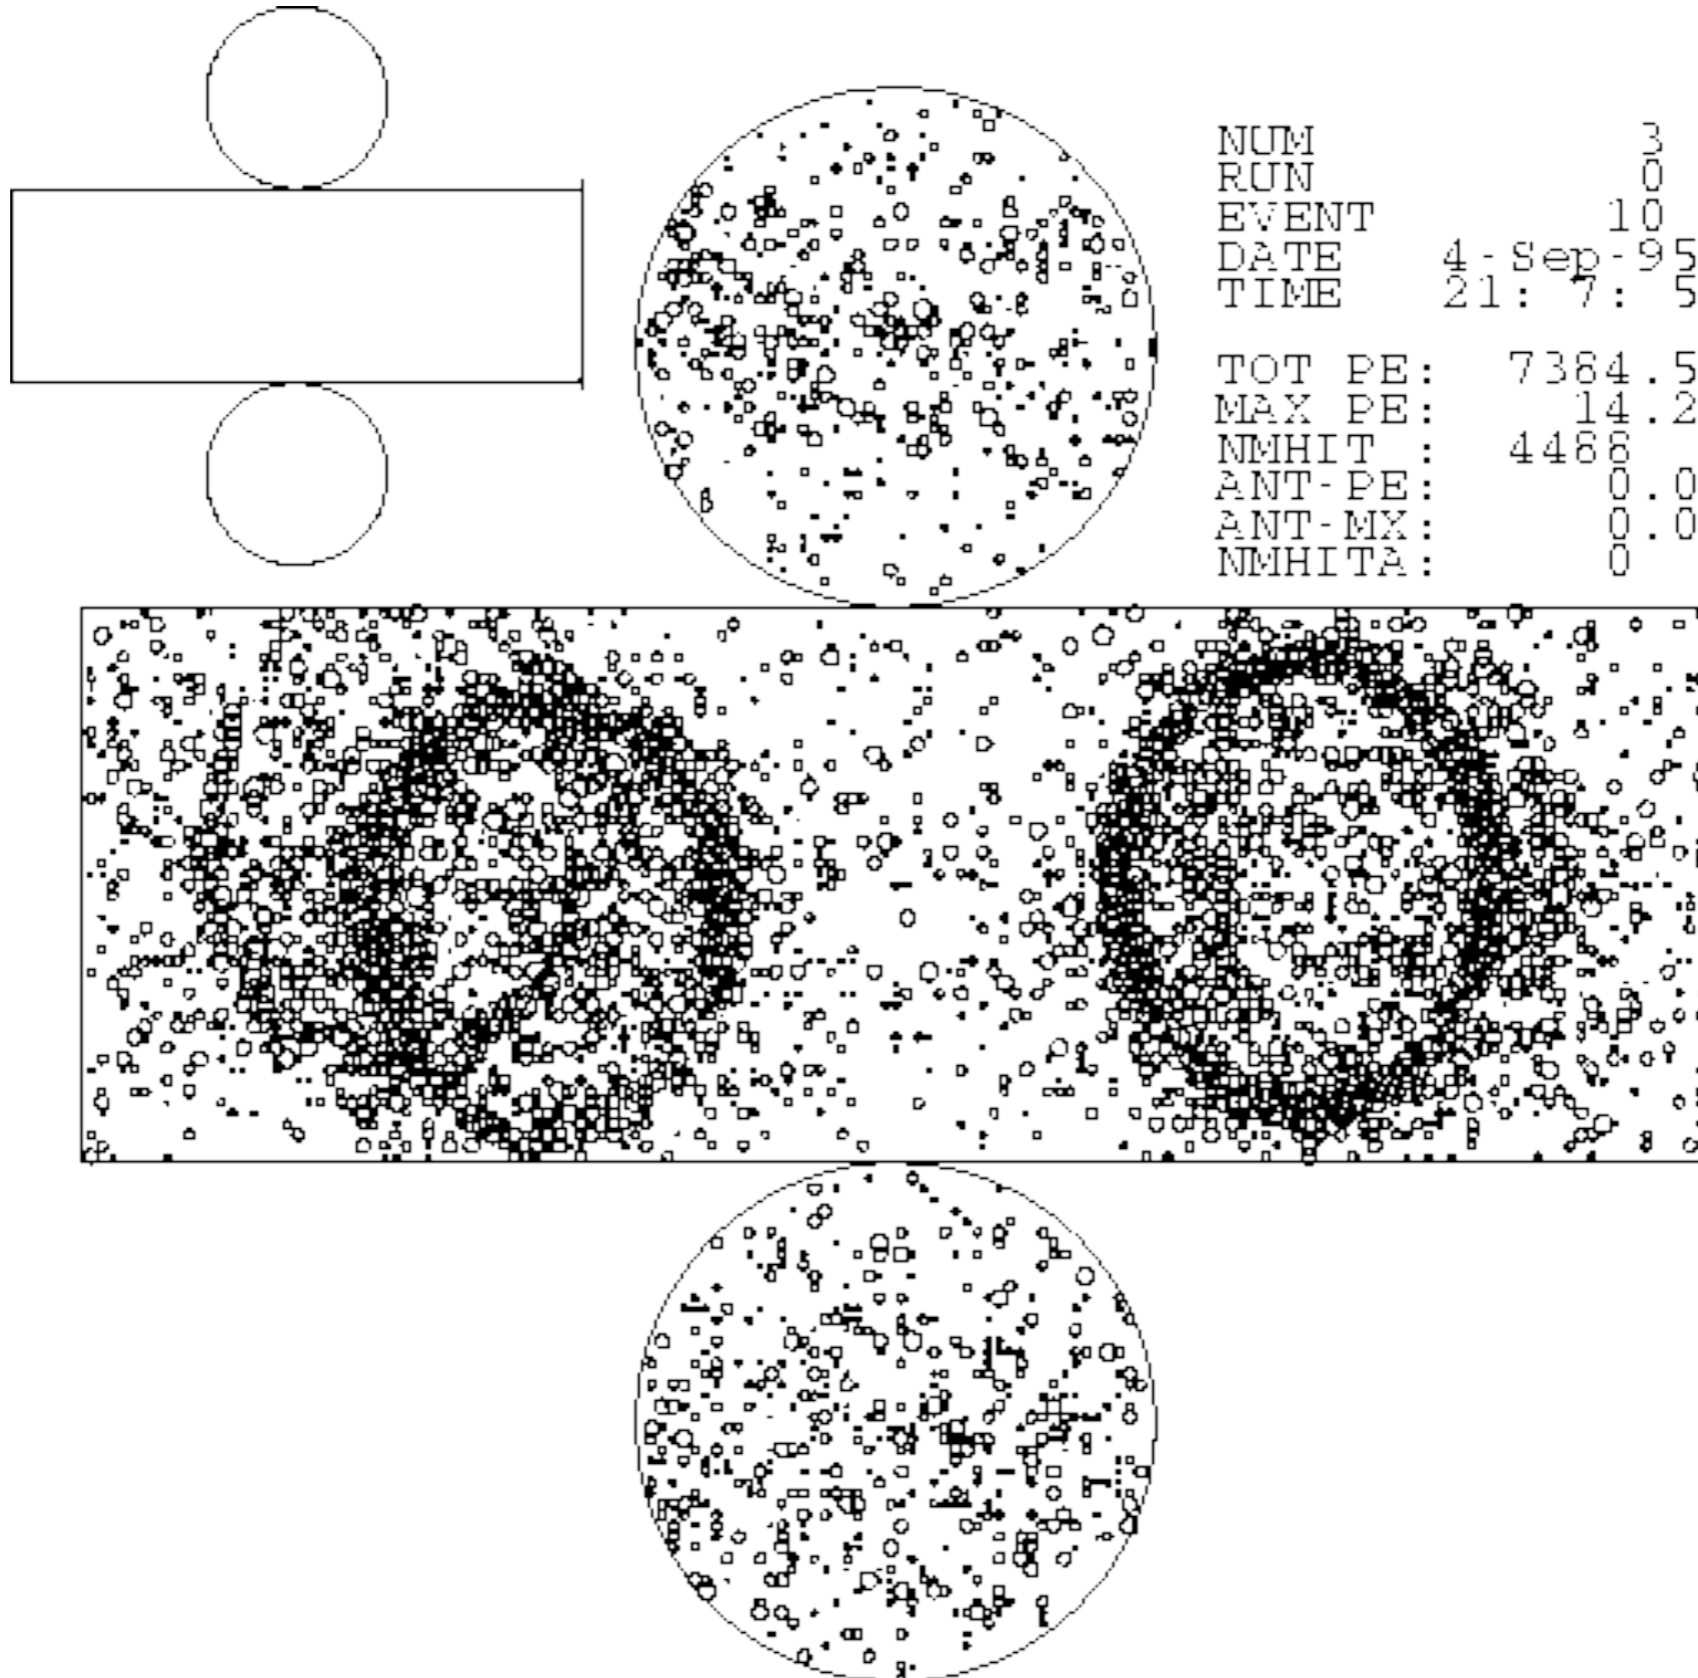

10^{20} POT were delivered to the production target

Super-K Event

Booster Neutrino Experiments

- Booster Neutrino Beam at Fermilab
- MiniBooNE
 - proposed 1998
 - started 2002
 - still running
- SciBooNE
 - proposed 2005
 - started 2007
 - finished 2008

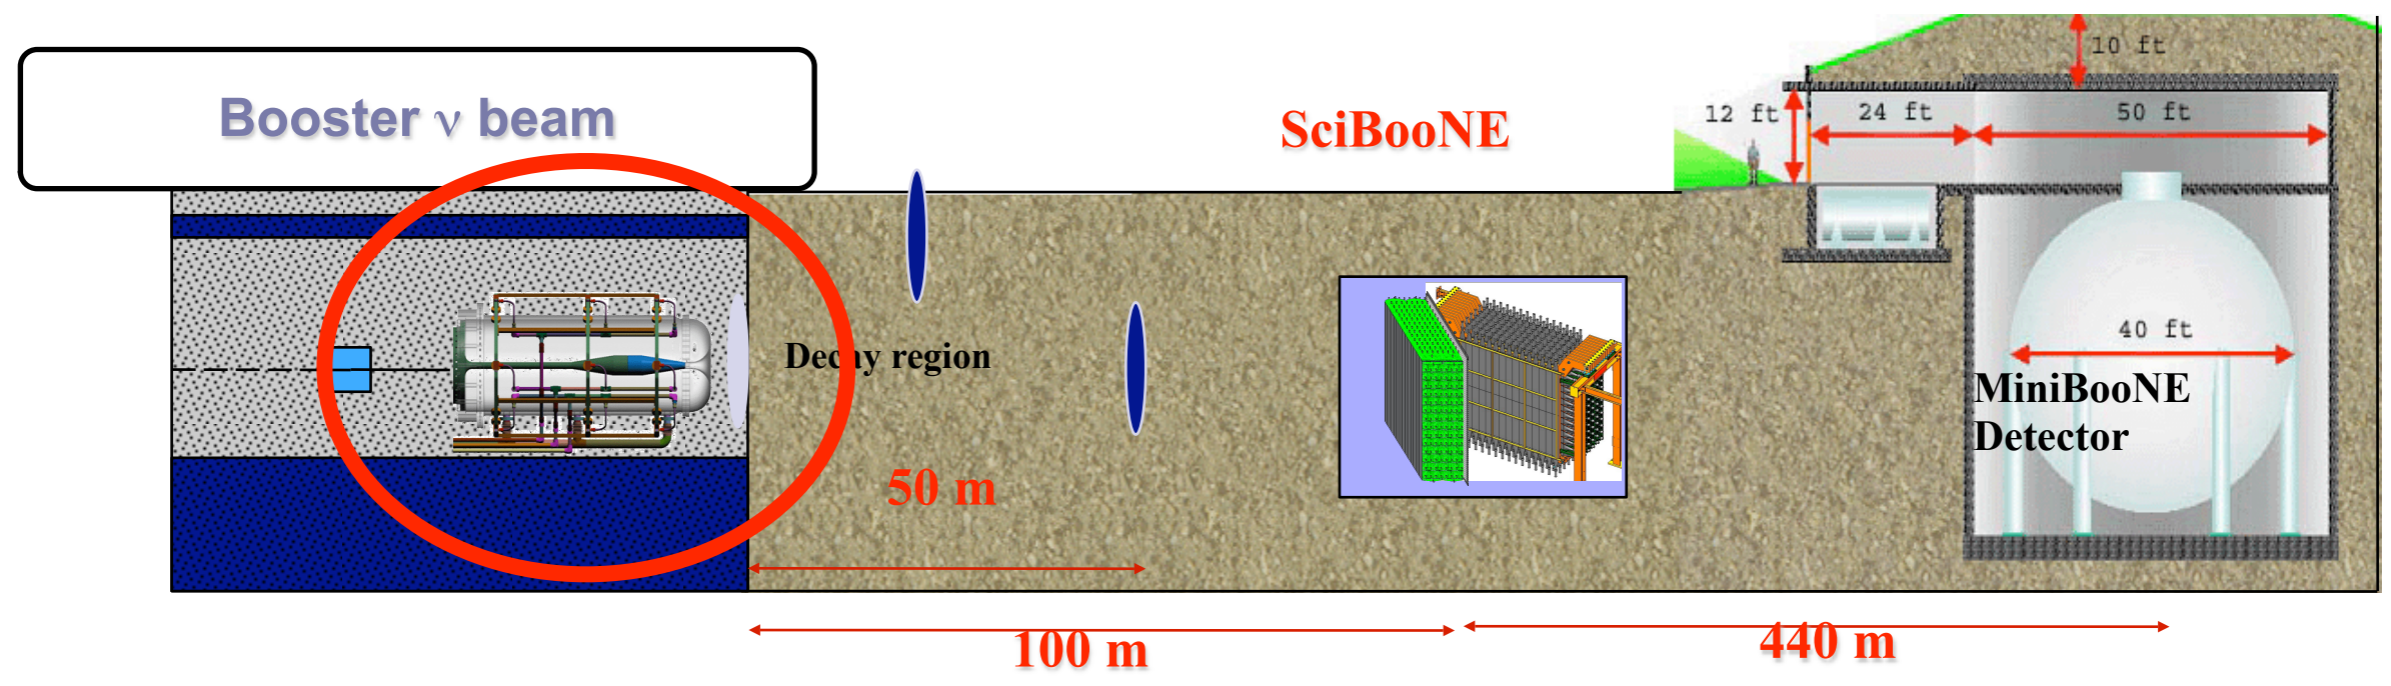

BooNEs Overview

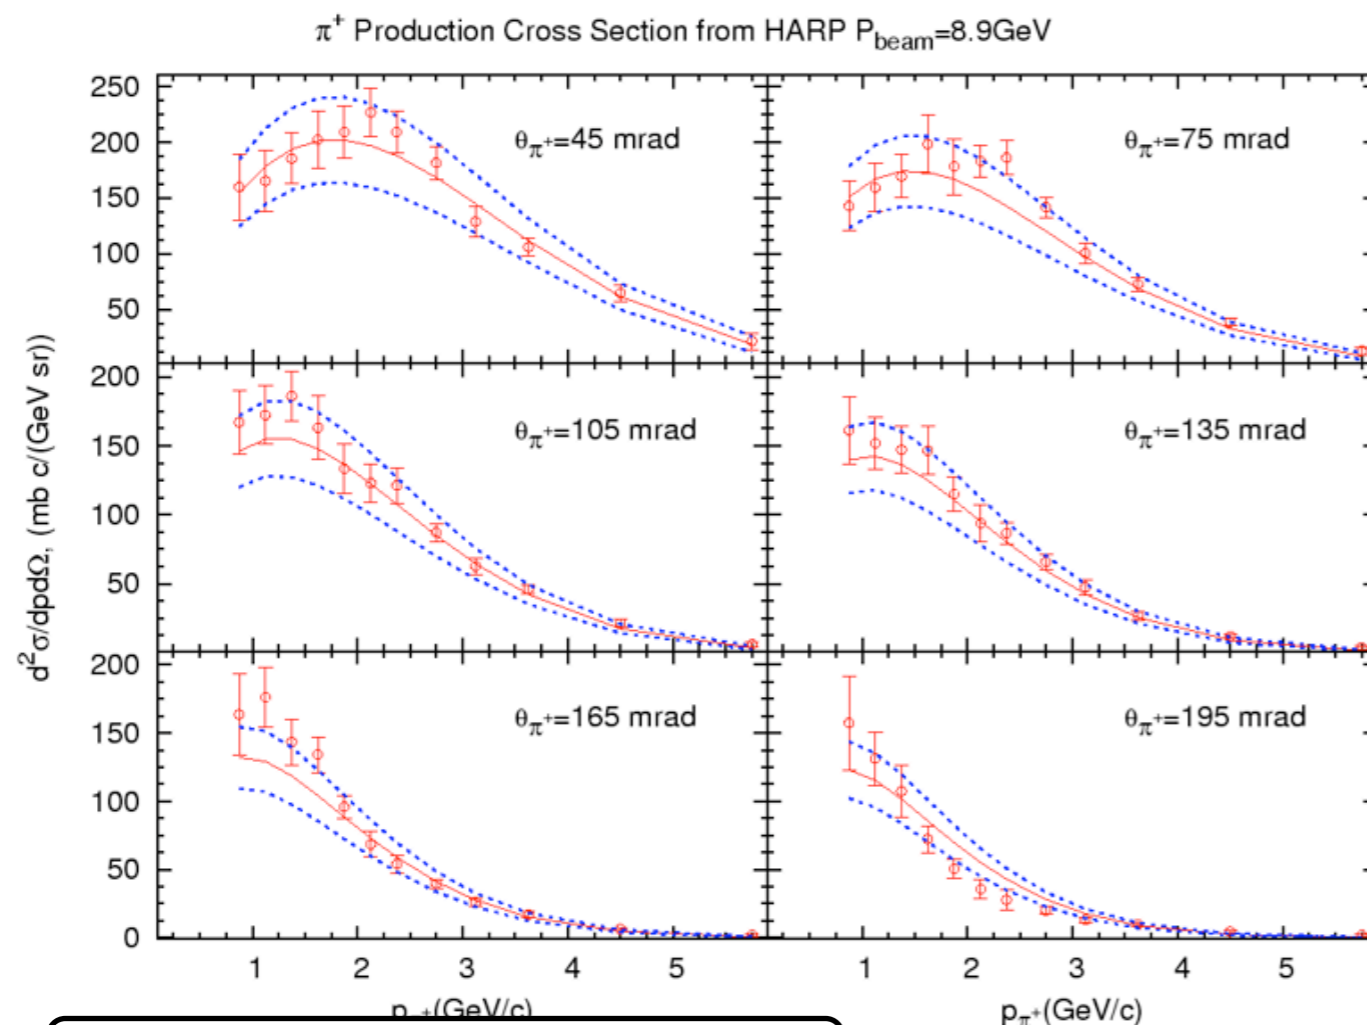

Target & Horn

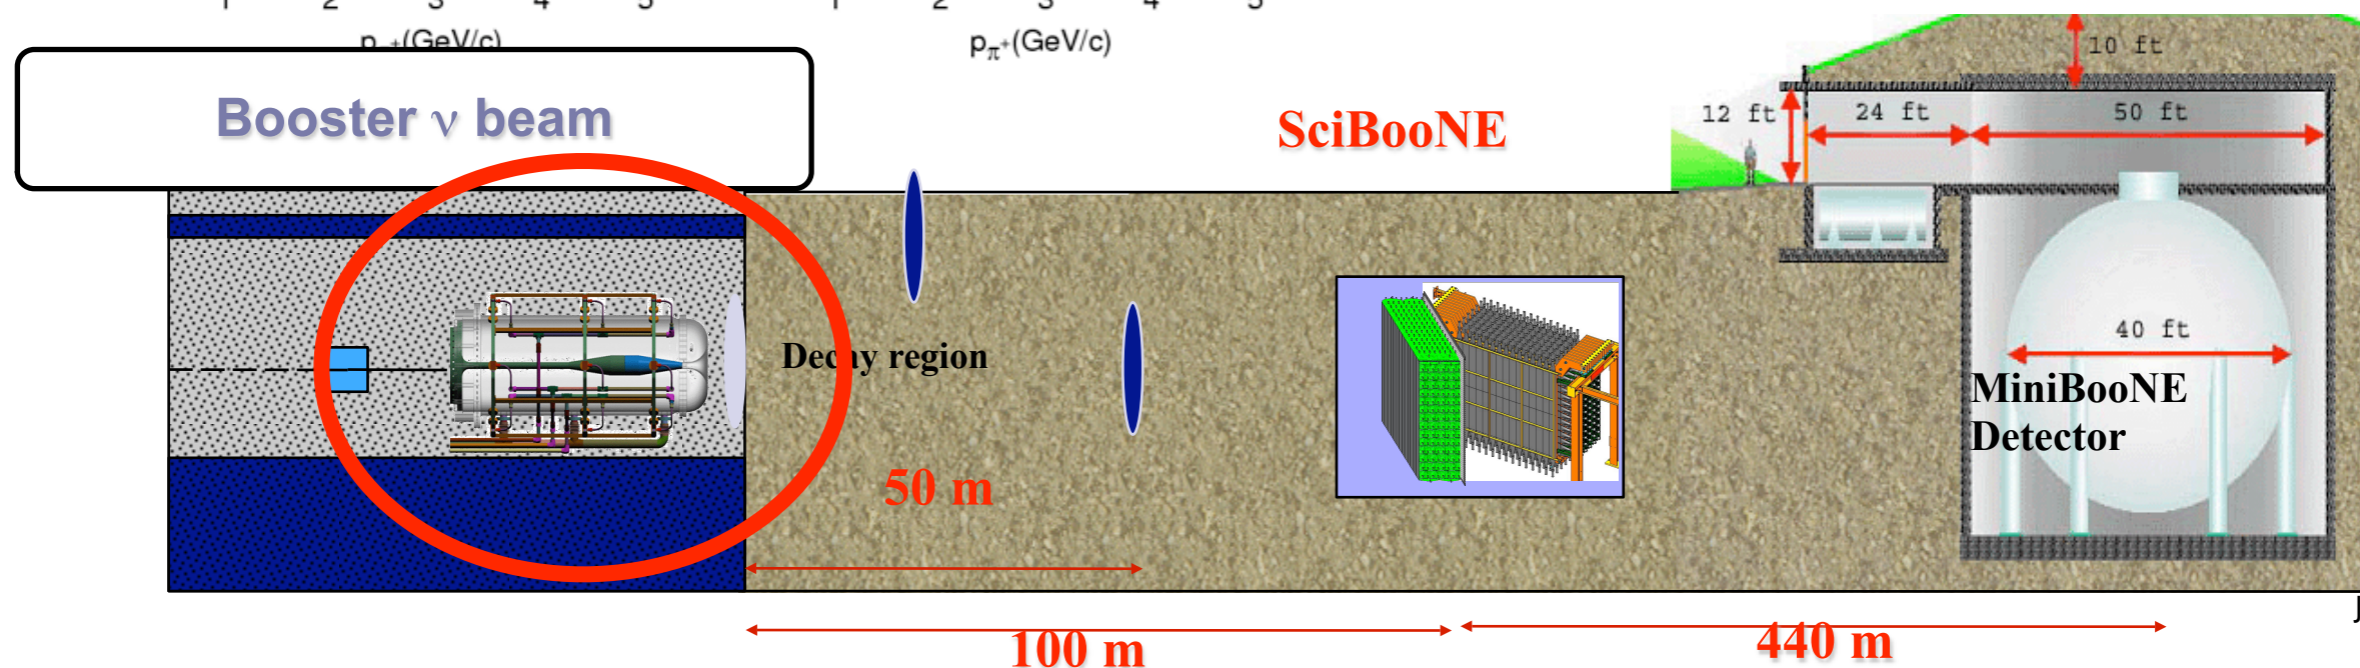

Main components of Booster Neutrino Beam (BNB) (96M and 200M+ pulses)

Meson Production

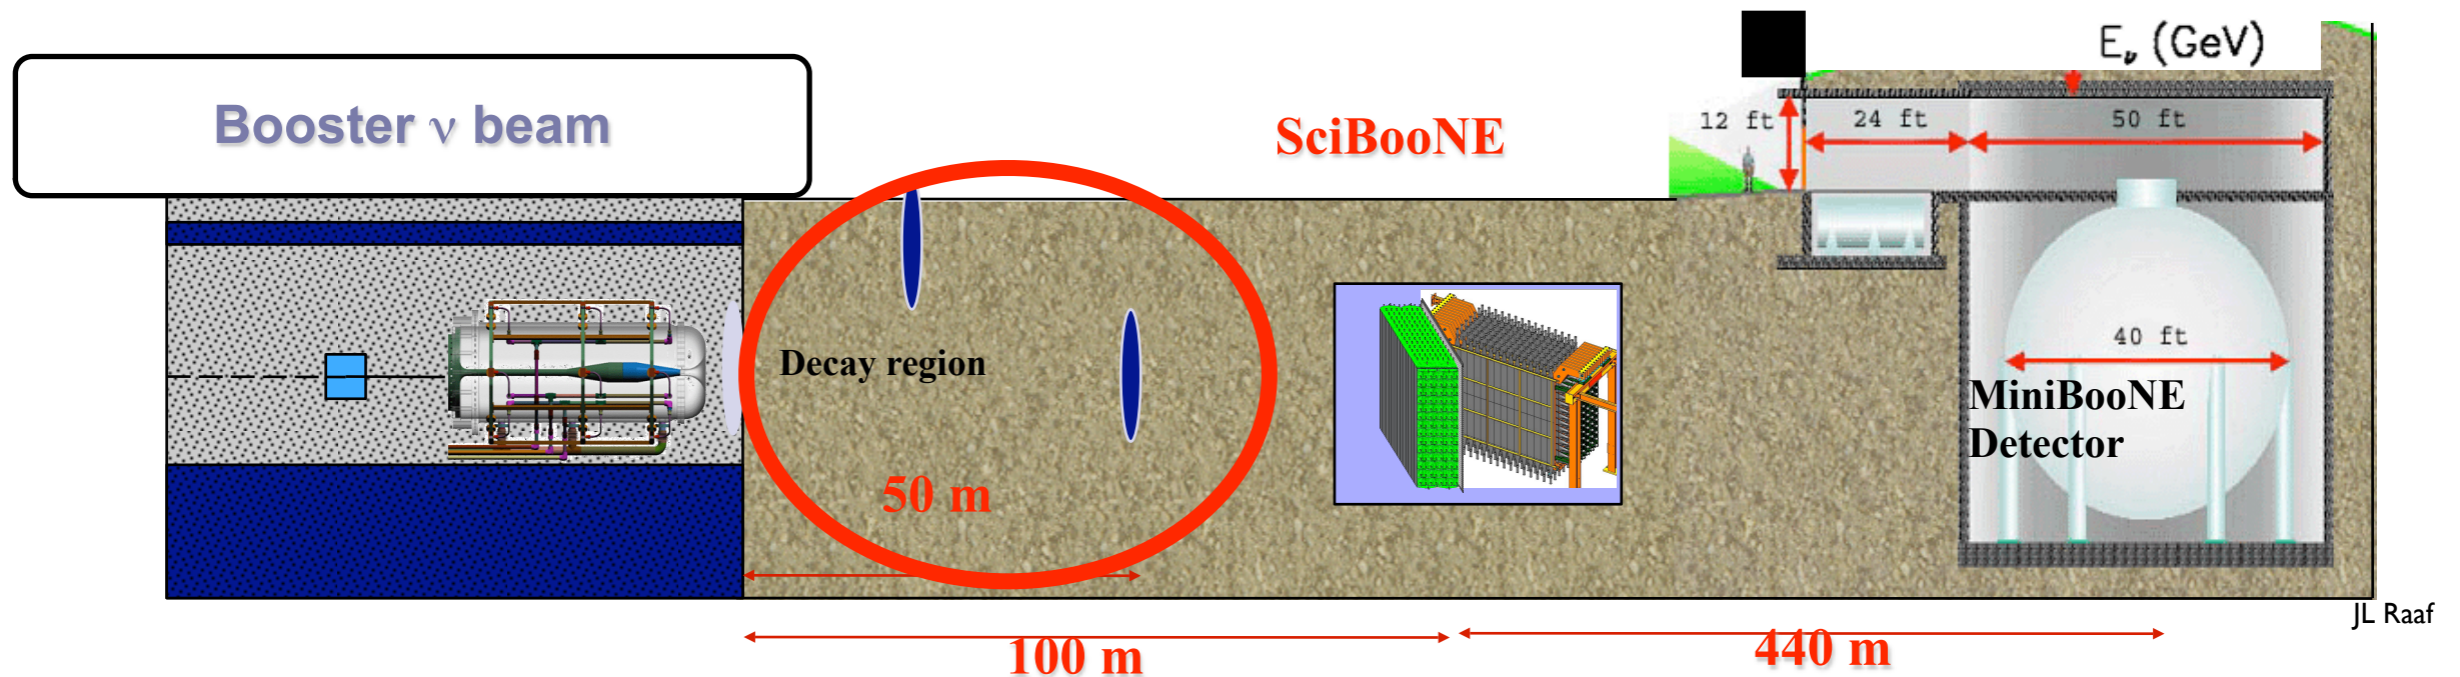

- External meson production data
 - HARP data (CERN)
- Parametrisation of cross-sections
 - Sanford-Wang for pions
 - Feynman scaling for kaons

ν Flux

- 99.5% pure muon flavour
- 0.5% intrinsic ν_e
- Constrain ν_e content with ν_μ measurements

MiniBooNE

SciBooNE

Decay region
50 m

MiniBooNE
Detector

100 m 440 m

MiniBooNE Progress

Number of Horn Pulses

To date: 303.18 million
Largest week: 2.69 million
Latest week: 0.95 million

Number of Protons on Target

To date: 12.6114 E20
Largest week: 0.1208 E20
Latest week: 0.0435 E20

Number of Neutrino Events

To date: 916559
Largest week: 11447
Latest week: 976

Mineral Oil Optics

- Production:
 - Cherenkov and scintillation
- Secondary:
 - Fluorescence and scattering (Raman, Rayleigh)

Extinction Rate for MiniBooNE Marcol 7 Mineral Oil

Track Images

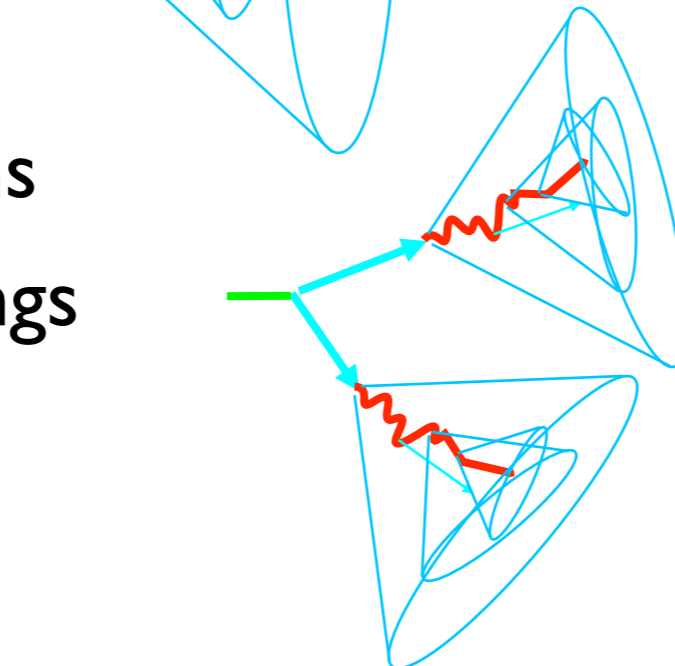

- Muons
 - full rings

- Electrons
 - fuzzy rings

- Neutral pions
 - double rings

PMT Hit Clusters

- PMT hits clusters in time form “subevents”
- ν_μ events have 2 subevents
 - μ , followed by e
- ν_e events have 1 subevent

- Simple cuts on subevents remove cosmic backgrounds
- “pre-cuts”

Track Reconstruction

Charged particles produce Cherenkov and scintillation light in oil

PMTs collect photons, record t, Q

Reconstruct tracks by fitting time and angular distributions

Find position, direction, energy

MiniBooNE

Measurements

- Default MC=NUANCE
- CCQE
- CC| π^+
- CC| π^0
- NC π^0
- NCE
- Antineutrinos

SciBooNE

SciBar

(EC)

ν beam

Booster ν beam

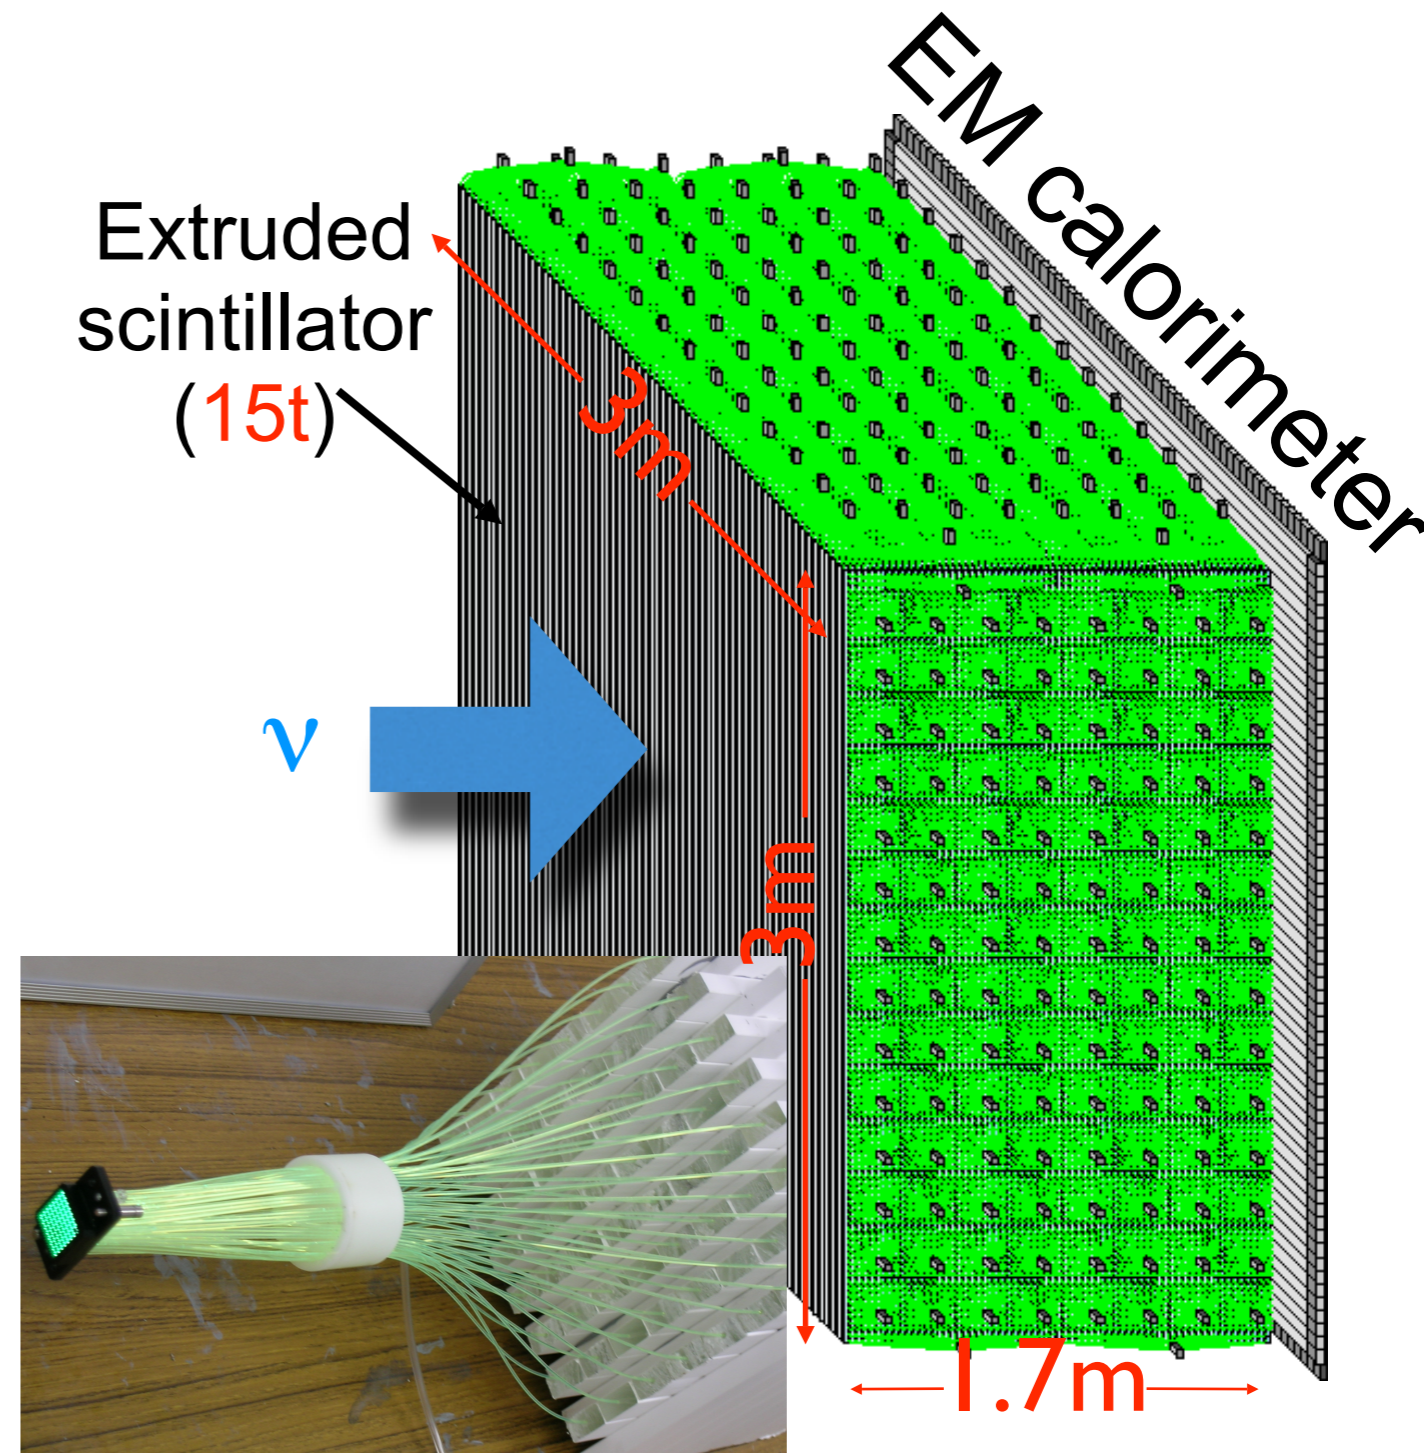

100 m 440 m

Vertex Detector: SciBar

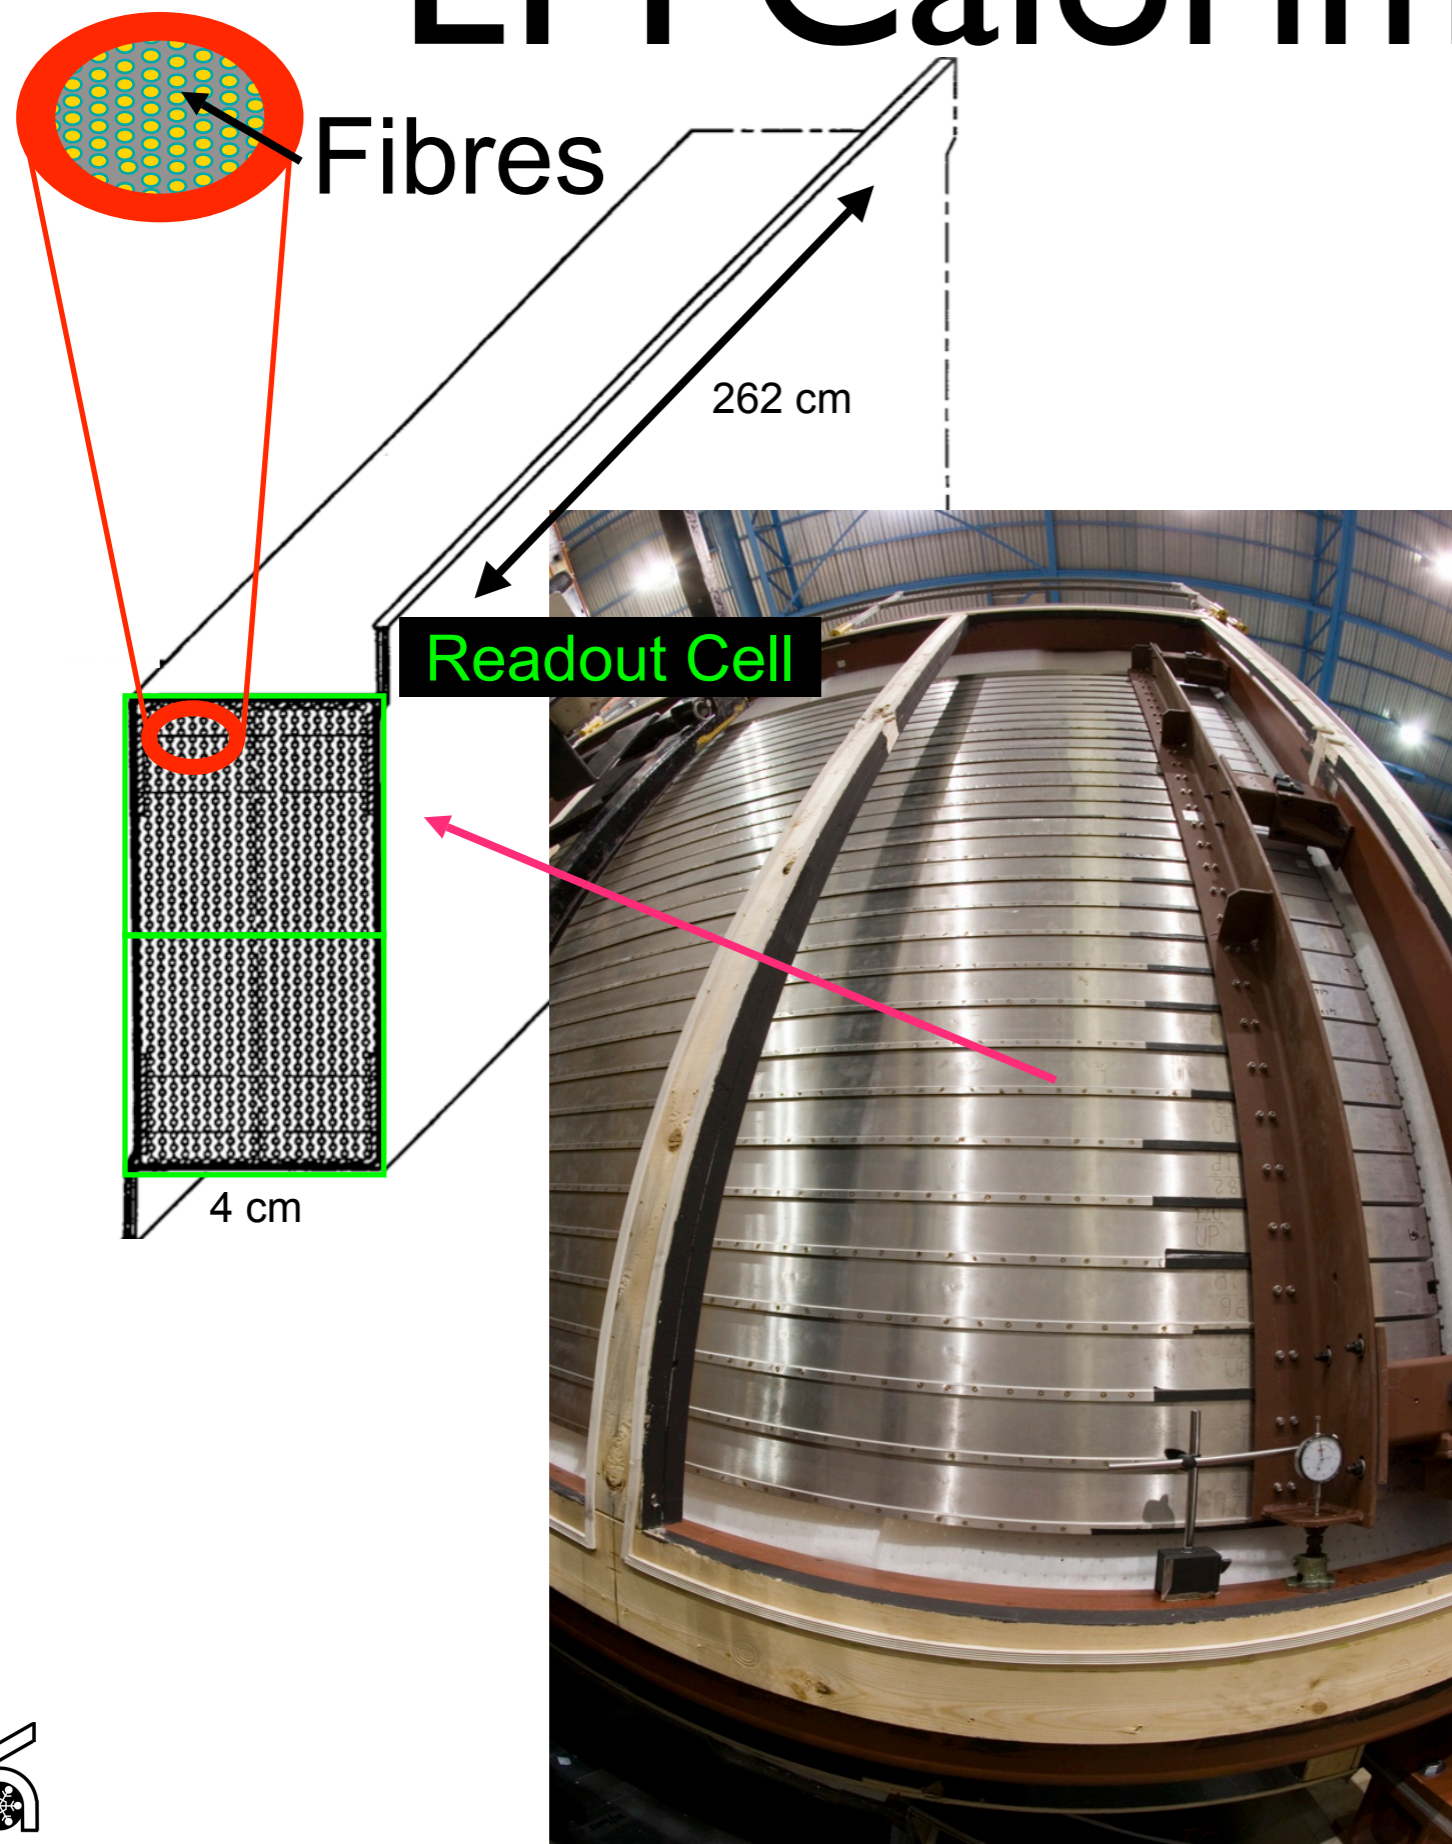

- Fine-grained neutrino vertex detector
- Extruded plastic scintillator with WLS fibres
 - 64 channel MAPMTs
 - ~15k channels
 - All channels operational
- 15 tonne total mass

Originally used in K2K experiment in Japan

EM Calorimeter: EC

- “Spaghetti” calorimeter
 - Scintillating fibres sandwiched in lead foils
 - PMT readout at both ends
- good energy resolution and linearity
 - $14\%/\sqrt{E}$ resolution
 - MC tuned with cosmic data
- $11 X_0$ thick

*Originally built for CHORUS;
used in K2K*

Muon Range Detector

- Iron plates (5cm) with scintillation counters
- Measure up to ~ 1.2 GeV muons
- $\sim 5\%$ momentum resolution

Recycled from past FNAL experiments

Won DOE "Closing the Circle" and P2 awards

SciBooNE Performance

SciBooNE installed and commissioned in spring 2007

SciBooNE

Measurements

- CCQE
- CC $I\pi^+$
- CC π^0
- NC π^0
- NCE
- Antineutrinos

Future: MINER ν A

- MINER ν A is designed to study ν -nucleus interactions with unprecedented detail
- The detector will be placed upstream of the MINOS Near Detector in the NuMI beam line
- The NuMI beam provides a wide range of neutrino energies
- Detector with several different nuclear targets allows study of neutrino nuclear effects
 - Unique to this experiment!

Other Experiments

- Oscillation experiments developing increasingly complex near detectors
- MINOS, NO_vA
- T2K ND280
 - High resolution detector
 - Most powerful nu beam
- MicroBooNE
 - Liquid Argon
